Examining test reliability and validity is essential for all state content assessments, but especially when drawing conclusions about students belonging to minority groups, such as ELs. Test reliability is defined as "a measure of the extent to which test scores are consistent across testing conditions, such as across different test items or upon retest" ([Moore et al., 2020](#)). Whereas test validity is defined as the degree to which a test measures the targeted construct of the test. When examining the reliability and validity of assessments for ELs it is important to assess the way in which the language of the test plays a role, because language as a source of construct irrelevant factor may have a substantial impact on assessments.

Some studies show a high significant difference in the reliability of assessment results between EL and non-ELs. In a technical brief on ELs' scores on the ACT, the researchers found that "the reliability of ELs' scores were consistently lower than those of non-ELs" ([Moore et al., 2020](#)). [Moore et al. \(2020\)](#) add that these reliability issues between ELs and non-ELs are also observed in other standardized tests like the Partnership for Assessment of Readiness for College and Careers ([PARCC, 2017](#)) and the Smarter Balanced Assessment Consortium ([SBAC, 2016](#)). Reports on EL's performance on standardized tests make it clear that components with a high level of linguistic complexity can lower reliability estimates of an assessment ([Moore et al., 2020](#)). To add, [Noble et al. \(2014\)](#) found that ELs were more likely to answer incorrectly on science test items than their non-EL peers, despite demonstrating knowledge of the science content assessed in the test item. When interviewing EL students, the researchers found that ELs misunderstood the test items because of the way that the questions were worded. For example, the test question "If enough heat is taken away from a container of water, what will happen to the water?" caused some ELs to interpret the question as "What would happen when you heat the container of water?" or that the water was taking heat from a heat source ([Noble et al., 2014](#)).

It is also clear that language plays a factor in the reliability of these assessments for ELs. For example, [Abedi \(2002\)](#) found that ELs consistently underperform in areas such as ELA, math, and science; however, the performance gap widens in areas with higher language demand. Similarly, [Abedi et al. \(2003\)](#) found that as students' level of English proficiency decreased so did the internal consistency, or how reliable the test measure is across items, of the test, which demonstrates how language affects ELs' test performance. Therefore, the reliability of the assessment is not only affected by EL status but also by level of English proficiency.

[Huang and Bulter \(2020\)](#) explored four empirical studies focused on the validity of assessments for language minority students in four different parts of the world and concluded that special attention to the specific needs of the language minority group being assessed is required when developing assessments. This is especially true when the assessments hold high stakes as statewide content assessments do for ELs in the US. [Abedi \(2006a\)](#) states that although there are various factors that can affect the way all students perform on a test (i.e., the test's validity), factors related to unnecessary linguistic complexity most affect students who are not proficient in English since their limited English skills hinders their ability to perform on tests. Statewide tests in the US are presented in English, which is the language that the EL is not yet proficient in, and therefore contain unnecessary linguistic complexities such as construct-irrelevant variance (i.e., language that is not related to the focal construct) that threaten the validity of the assessments ([Abedi, 2006a](#)).

Reliability and validity of other standardized assessments

Although this chapter mainly focuses on statewide assessments in the US, the authors also wanted to comment on the reliability and validity of other types of standardized tests used across the world, as they are often used to make inferences about student subgroups such as ELs. Specifically, tests like Peabody Picture Vocabulary Test-4 (PPVT-4; [Dunn and Dunn, 2007](#)) and the Structured Photographic Expressive Language Test: Third Edition (SPELT-3; [Dawson et al., 2005](#)) will be explored below because these tests have proven to be reliable and valid measures for the general student population. For example, [Pearson \(2007\)](#), the publishers of PPVT-4, report high levels of reliability in forms of internal consistency and test-retest and high levels of validity. SPELT-3 also showed high levels of reliability and validity in its development ([Dawson et al., 2003](#)). However, careful examination is needed when considering if the same level of reliability and validity can be applied to ELs.

Researchers believe that PPVT-4 holds bias against ELs and is not a reliable measure for this student group. [Goriot et al. \(2018\)](#) explored the reliability of PPVT-4 for ELs whose first language is Dutch and found that the test was most reliable for students who answered 24 or more items correct. The researchers conclude that PPVT-4 is most suitable for ELs that have higher levels of English proficiency. Another study compared the performance difference between students whose first language was either French or Polish and found that PPVT-4 and similar vocabulary-based tests could be biased based on students' first language ([Leśniewska et al., 2018](#)). Additionally, [Finneran et al. \(2019\)](#) conducted a study to explore the performance differences across African American and Hispanic students (majority of which were ELs) in the US and found that despite both groups were from low-income communities, PPVT-4 had potential cultural-linguistic biases that did not favor Hispanic students.

Research on SPELT-3 is much more limited than PPVT-4, especially on student subgroups such as second language learners in other countries. In the US SPELT-3 has shown applicability due to its high accuracy in differentiating between students with and without language impairments ([Perona et al., 2005](#)). The version for preschoolers (called SPELT-Preschool 2; [Dawson et al., 2005](#)) is highly correlated to another expressive grammar test, which strengthens its case for strong concurrent validity and diagnostic accuracy ([Greenslade et al., 2009](#)). Another study examining SPELT-P2 also supports the use of this test as a way of determining language disabilities in preschool-aged students; however, the researchers clearly mention that the participants only spoke English and that those that indicated that they spoke another language at home (i.e., ELs) were excluded due to "concerns about the validity of the criterion measures for nonmainstream speakers" ([Eisenberg et al., 2019](#)). The way in which ELs have been excluded demonstrates the need for research exploring the reliability and validity of these tests specifically for ELs.

Accessibility of state content assessments

Assessments are said to be "accessible" to ELs if all extraneous variables that are not related to the focal construct are controlled. The assessments can be constructed based on "accessibility" guidelines or if relevant accommodations are included in the assessment in order to minimize the impact of extraneous variables, such as the impact of cultural biases and language complexity. For example, the work of the Race to the Top consortia, which was funded by the [American Recovery and Reinvestment Act \(2009\)](#) in the US, involved SBAC and PARCC and led to more accessible and valid assessments for the nation ([US Department of Education et al., 2013](#)). The consortia paid special attention to the research-based decision process on the concept of "accessibility."

Accommodations for ELs on state content assessments

Accommodations that are effective in making assessments more accessible for ELs can be used as accessibility features and can become part of a standardized test administration process, the same is true for students with disabilities (SWD). [Abedi \(2012\)](#) states that accommodations for ELs must be effective, valid, relevant, feasible, and sensitive to students' background characteristics. If accommodations meet these criteria, then assessments will become more accessible for ELs ([Abedi, 2017](#)).

These accommodations can be grouped under two categories: (1) accommodations that may have no conceivable impact on the focal construct (e.g., extra time or test administration directions that are simplified), and (2) accommodations that may have some direct or indirect influence on language as the focal construct (e.g., commercial dictionary). Accommodations under the first category can be used for ELs and SWD as appropriate accommodations (since they are not providing an unfair advantage to the recipients); or as accessibility features for all because everyone may benefit from these features. However, accommodations under the second category can be considered as accessibility features when used for all students since using them for a certain group of students may not be a good practice as they may provide unfair advantages to the recipients.

Accommodations for ELs can also be divided between those that provide direct and indirect linguistic support ([Shafer Willner et al., 2008](#)). The researchers simply differentiate between the two types of accommodations by defining direct linguistic support accommodations as modifications related to the language of the test (examples thoroughly described later), meanwhile the researchers define indirect linguistic support accommodations as modifications not related to the language of the test (e.g., extra time, breaks, changes to test setting such as small group and familiar environment). This chapter will focus on direct linguistic support since the main goal of language-based accommodations is to increase the linguistic accessibility of assessments. As [Sireci and Faulkner-Bond \(2015\)](#) point out, one way to increase the validity of statewide content assessments for ELs is to provide accommodations that may reduce the linguistic barrier. Below is a quick description and brief literature review on four language-based accommodations that have been researched in hopes of making assessments more accessible for EL students: first language translation, glossary, read-aloud, and linguistic modification.

First language translation

The first language translation accommodation provides a translated version of each test item in the students' first language. Some research reveals that this accommodation is most effective for students with high language skills in their first language ([Abedi and Ewers, 2013](#)). For example, [Robinson \(2010\)](#) found that Spanish-speaking ELs in kindergarten and first grade scored significantly higher on Spanish versions of a math test. However, other research shows that this accommodation is not effective. In a recent study, [Abedi et al. \(2020\)](#) conducted a randomized controlled trial with this accommodation, in which only students who performed at a certain level on a Spanish language assessment were randomly offered one of two Spanish-based accommodations, one of which was a Spanish translated version. The researchers found that students score significantly lower than students who took the same test without an accommodation. [Abedi \(2017\)](#) points a major flaw with this accommodation, as there is potential for lack of alignment between the students' first language (i.e., the language of the translated test) and the language of instruction.

Glossary

The glossary accommodation provides simplified definitions of vocabulary terms not related to the focal construct of the test item. On computerized tests students can hover over the selected term and then the glossary item will pop up when clicked on. An earlier version of this accommodation was the dictionary accommodation which provided dictionary-based definitions; however, glossaries seem to be more effective than dictionary accommodations (Abedi and Ewers, 2013).

A metaanalysis by Abedi and Ewers (2013) revealed that the glossary-based accommodation showed some promise but needs more research to examine its effectiveness. Chia (2014) also called for more research in the use of glossary accommodations, as further guidance is needed on which terms should have a glossary and the amount of cognitive load associated with the additional information in glossaries. A recent study by Cohen et al. (2020) found that computer-based, pop-up glossaries were effective on both ELA and math tests and did not alter the focal construct. Similar to Chia (2014), Cohen et al. (2020) also noted the trouble with determining which words should have a glossary. To address this issue, Cohen et al. (2020) used a carefully formulated coding procedure to determine which words required a glossary. Additionally, Chia (2014) listed categories of terms that SBAC has integrated into their glossary-based accommodations including: “nominalizations, false cognates, informal English used in an academic context, prepositional phrases that can have multiple meanings, and relative pronouns directly related to the task at hand.” Research-based guidelines on how to determine which terms need a glossary could help in determining how to make this accommodation most effective for ELs.

Read-aloud

The read-aloud accommodation provides students with a word for word read-aloud of the test items by person or electronic media. As Abedi and Ewers (2013) describe, there are various types of read-aloud accommodations such as read aloud of test directions in students’ first language and read aloud of test questions in English. The researchers’ metaanalysis reveals inconsistent effectiveness across ELs based on level of English proficiency, subject area, and grade level. Sireci Faulkner-Bond’s (2015) metaanalysis also reports on the mixed results on the effectiveness of this accommodation. Specifically, Wolf et al. (2012) studied this accommodation in two states and found that the read-aloud accommodation resulted in no effect for ELs in one state and a significant positive effect for ELs in the other state.

Linguistic modification

The linguistic modification accommodation reduces the linguistic demand on tests by minimizing the level of linguistic complexity and removing all unnecessary linguistic factors unrelated to the content assessed. A major aspect of the linguistic modification accommodation is removing unnecessary linguistic complexity from test items. The accommodation involves modifying linguistic features that may be appropriate for non-ELs but complex for ELs. Abedi (2006b) breaks down linguistic features that could be modified to make test items more accessible to ELs and thus increase the chances of correctly measuring ELs’ content knowledge. These features are related to word familiarity; word, sentence, nominal, and question phrase length; voice of verb phrase (i.e., active vs. passive); structure related to sentence, discourse, and comparative; subordinate, conditional and relative clauses; negation; and concrete statements. Below is an example from Abedi (2006b) that applies linguistic modification to transform an abstract statement into concrete terms:

Original: The weights of three objects were compared using a pan balance. Two comparisons were made

Revision: Sandra compared the weights of three objects using a pan balance. She made two comparisons

In this example, the revised version contains active voice verbs, while the original contains passive voice verbs (Abedi, 2006b). Although at times the linguistic modification accommodation is referred to as “linguistic simplification,” Abedi et al. (2020) disagrees this term as it implies that the linguistic complexity is simply reduced and does not take into account that unnecessary linguistic factors should be removed. Overall, research on this accommodation is mixed (Abedi and Ewers, 2013). More information on unnecessary linguistic complexity and its use in the linguistic modification accommodation will be discussed below.

Current issues

This section of the chapter will focus on three main issues related to ELs’ performance on state tests including: (1) unnecessary linguistic complexity in content-based assessments such as math and science; (2) the need for effective, valid, and researched-based accommodations specifically adapted to assist the language needs of ELs; and (3) the need for guidelines on how to assign accommodations to ELs. The issue with analyzing ELs’ performance with ELs as one homogeneous group will also be discussed.

Unnecessary linguistic complexity

Unnecessary linguistic complexity can serve as a construct irrelevant factor and has a considerable impact on the reliability and validity of assessments for ELs. The effect of unnecessary linguistic complexity has been studied in ELs for decades now and research points to overall mixed results for its use as an accommodation (Abedi and Ewers, 2013). An issue with removing unnecessary linguistic complexity from test items is determining the linguistic features that are unnecessary to measure the focal construct. However, it appears that more recently developed tests have taken great efforts to remove unnecessary linguistic complexity for all students to make the content being assessed more straightforward.

Proof for the effectiveness of the linguistic modification accommodation has been shown in some research. In the early 2000s, Abedi and Lord (2001) modified the language demand on a math test by reducing the level of linguistic complexity and found that there was a statistically significant improvement for ELs on linguistically modified test items. The researchers explain that in interviews students expressed preference for items that were linguistically modified. Abedi and Lord (2001) found that EL students performed almost the same as their non-EL peers in a mathematics problem-solving test where there was minimal or no unnecessary linguistic complexity as compared to reasoning items with complex linguistic structure. Below is an example of a math question in its original form followed by a modified version with decreased linguistic complexity from Abedi and Soto (2008).

Original:

Alba needed to know about how much the sum of 19.6, 23.8, and 38.4 is. She correctly rounded each of these numbers to the nearest whole number. What three numbers did she use?

- A. 19, 23, 38
- B. 19, 24, 38
- C. 20, 24, 38
- D. 20, 24, 39

Revision:

Look at the numbers below.

19.6 23.8 38.4

Which list shows each number rounded to the nearest whole number?

- A. 19 23 38
- B. 19 24 38
- C. 20 24 38
- D. 20 24 39

In this example linguistic modification was used by removing information not needed to solve the question, changing the verbs to present tense, and using less complex sentence structures (Abedi and Soto, 2008).

Other research also shows support for the use of the linguistic modification accommodation for ELs. For example, Wolf and Leon (2009) investigated the association between language complexity and degree of differential item functioning (DIF; i.e., “when the probability of answering an item correctly is different between the two groups of interest who have the same ability level”) for ELs and found that as the level of academic vocabulary and amount of language increased so did DIF statistics for ELs. Similarly, Martiniello (2009) analyzed ELs’ math test performance and found that ELs are more likely to underperform on linguistically complex items when compared to their non-EL peers. To add, Keh (2019) assessed 11 ELs in a series of three assessments and compared their scores to existing data for English proficient students. Based on an analysis of the ELs’ performance, the researcher believes that modifications to linguistic aspects (e.g., orthography, phonology, syntax, and vocabulary) of the tests could improve ELs’ performance.

Meanwhile, other research shows mixed support for the use of linguistic modification as an accommodation. For example, although ELs scored slightly better on the linguistically modified version of a math test, Abedi et al.’s (2020) study did not show that linguistic complexity significantly affected ELs’ test scores. Similarly, a report published by the Educational Testing Service led by Young et al. (2014) found mixed results for the use of linguistic modification as an accommodation and add that at times the scores of both non-ELs and ELs improved, worsened, or did not change on science items with linguistic modifications. Since one of the criteria to claim the effectiveness of an accommodation is that it results in an increase in performance for the target group (ELs) and no change in performance for the non-target group (non-ELs), Young et al.’s (2014) research shows that this accommodation did not cause a differential impact for ELs’ test performance.

A recent study by Noble et al. (2020) found that the effects of the linguistic modification accommodation rely on the specific modifications made to specific test questions, meaning that the type of modifications performed by researchers and test developers must be carefully executed to determine the accommodation’s true effects on ELs’ performance. However, like other studies mentioned, the researchers noted no statistically significant results although there were some differences across the test performance of the EL groups. Although there are mixed results on the effectiveness of the linguistic modification accommodation, the way in which there is some level of differential performance across ELs groups reveals that this accommodation has potential to increase the

accessibility of assessments for ELs. Future research could work on developing a universal method to remove unnecessary linguistic components as mentioned by Noble et al. (2020). Future research could also ensure experimental controlled design and sufficient sample sizes to generate results that are valid and reliable.

An issue with the concept of unnecessary linguistic complexity is defining language as related or unrelated to the content being measured in order to determine how to remove the complex linguistic structure from the test items without altering the focal construct. Based on literature, this decision can be made collectively by a group of experts including linguists, test developers, and researchers who focus on student assessment practices (Abedi, 2015). Together this multidisciplinary team can determine the language factors in the test items that could be considered not directly related to the focal construct (i.e., “construct irrelevant”). However, consensus across multidisciplinary teams is ideal in order to develop established guidelines on how to properly remove unnecessary linguistic complexity from test items.

A challenge with using linguistic modification as an accommodation for ELs is that level of complexity should not alone determine inclusion of a linguistic feature (Avenia-Tapper and Llosa, 2015). Instead, Avenia-Tapper and Llosa (2015) argue that linguistic modification should focus on the degree of relevance language terms to the content being assessed. To add, the researchers state that the level of construct-irrelevance associated with linguistic complexity should be determined by examining the “the degree of correspondence between language use in the assessment and language use in the educational contexts in which the content is learned and used.” The researchers implicate that test developers should utilize the language educators use to teach ELs science knowledge concepts, which will encourage the use of grade-appropriate science language. In support of this argument, familiarity is listed as a factor to consider when modifying linguistic demand on assessments for ELs. Various researchers who include linguistic modification in EL accommodation research like Abedi (2006b) support the idea that unfamiliar vocabulary and linguistic features should be removed and that terms used to teach students new material (i.e., familiar) should remain in assessments.

It seems to be that over the past years, unnecessary linguistic demands have been altered to focus on the content knowledge being assessed and test developers have adapted linguistic modification as a standard practice. Given that the linguistic modification accommodation in Abedi et al.’s (2020) study did not show to be significantly effective, the researchers believe that “given the literature on the general effectiveness of linguistic modifications, [the researchers] surmise that newer assessments, including those developed for [the] study, have been linguistically modified to the point that further linguistic modification has only a limited effect.” In fact, Sireci and Faulkner-Bond (2015) once argued, that instead of considering linguistic modification as an accommodation, it should be “part of the standard test development process.”

An overall finding from literature on ELs is that language proficiency does interfere with ELs’ ability to perform on English-language assessments. As demonstrated in a study conducted by Buono and Jang (2021), the researchers found that out of 11 math test items that had complex linguistic features, DIF analyses showed that ELs underperformed when compared to non-ELs on seven of the items. Researchers agree that language does interfere with ELs’ performance on test items not intended to measure English language proficiency; however, a conclusion on how to overcome the issue with unnecessary linguistic complexity is not yet resolved (Noble et al., 2020). Given that ELs and non-ELs continue to perform differently on statewide assessments and that the effectiveness of this accommodation has not yet been ruled out, it is worthwhile including it in future research as it has potential in making assessments more accessible for ELs.

Need for evidence-based accommodations

As mentioned earlier, one of the issues with research on accommodations is that metaanalyses reveal mixed results (Abedi and Ewers, 2013); therefore, a definite answer as to whether an accommodation is effective is not fully understood. Like all other research attempting to generalize their results, these studies should include a large enough EL sample size and provide statistically significant findings. To add, accommodations should be assigned based on evidence-based research and depend on each student’s needs. The main conclusion on current research on accommodations for ELs is that there is inadequate empirical data to thoroughly determine the effects of accommodations for ELs (Abedi, 2017).

Both a lack of statistically significant score differences between students receiving accommodations and no accommodations and small EL sample sizes are issues in accommodation research for ELs. For example, Rios et al. (2020) examined accommodations offered to ELs in a metaanalysis and found no statistically significant results to support the use of accommodations, although differences in test scores were observed. To add, in a randomized controlled study, Abedi et al. (2020) explored ELs’ performance on an assessment with randomly assigned accommodations and found that none of the accommodations significantly improved EL test performance. It is important to note that Abedi et al. (2020) encountered issues with a small sample size when only a couple of students were randomly assigned into the Spanish-based accommodations being evaluated. This occurred because not many students scored high enough on a Spanish language assessment to receive a Spanish accommodation (Abedi et al., 2020). A small sample size in research analyzing the effects of accommodations on ELs appears to be a recurring issue as Yeo (2010) state that research lacks studies with large EL sample sizes, which are necessary to generalize results.

Instead of attempting to guess which accommodation is best suited for ELs, appropriate accommodations should have an explicit rationale for their use. For example, a student whose first language is Spanish should not necessarily be given a test in Spanish; rather the accommodation should depend on the language of instruction and other relevant background variables (Francis et al., 2006). When accommodations were first assigned to ELs the accommodations came from a set of accommodations offered to SWD (e.g., testing students in multiple sessions or providing breaks) and have not proven to be significantly helpful for ELs (Abedi, 2017). It is not surprising to find that research points to a need for studies that assign accommodations based on students’ needs so

that specific needs are met with appropriate accommodations (Abedi and Ewers, 2013). A hypothetical example of a specific need could include variations in the level of English proficiency, such that a student with moderate-to-high English oral skills but low English written skills would receive a read-aloud accommodation.

Need for guidelines on assigning accommodations

Hand in hand with the need for evidence-based accommodations that have been proven to be effective for ELs is the need for a set of guidelines on how to assign accommodations to ELs. Some obstacles to developing a set of guidelines is that there is variability across states and within districts, students' unfamiliarity with accommodations, and mixed results in research that studies accommodations for ELs. In the past decades more ELs have gained access to accommodations for statewide assessments, however since statewide tests continue to hold high stakes it is important that accommodations on these assessments are properly assigned to ELs.

The regulation for assigning accommodation differs across the nation and across tests, so there is great variability in the guidelines on how to assign accommodations to ELs. Each state selects which statewide assessment will be implemented (e.g., some states use SBAC and other states like Texas develop and use their own state assessments) and the way that accommodations are assigned, which has both positive and negative implications. On the positive side, local control of accommodation assignment allows for regulations affecting different groups of ELs. This means that districts with large numbers of ELs with distinct backgrounds such as newly arrived or high Spanish-speaking can implement regulations educational leaders believe is best suited for their group of students. Local control also allows for quick changes since the regulations are not under widespread control, which gives educators the flexibility to quickly adapt the latest research findings into their accommodation assignment. However, on the negative side, establishing rules for assigning accommodations based on county lines or other geological factors means that location influences accommodation decisions instead of basing the decision solely on student needs. This also implies that the number of resources a school has available will determine which accommodations a student can receive. Differences in accommodation assignment creates inconsistency across the nation, which means that when ELs change schools they may be assigned a different accommodation despite having the same needs that they had at their previous school.

It is also important that students not only have access to accommodations while taking statewide tests, but also during classroom achievement tests. As mentioned by Abedi et al. (2020) students should be familiar with accommodations before being expected to use them in assessments. This way students are accustomed to using the accommodation and it does not cause confusion during a test, when students may feel additional stress. This point is also reiterated in interviews by Wolf et al. (2012) where students expressed unfamiliarity with a glossary-based accommodation and thus did not use it during the assessment. On computer-based assessments students' use of accommodations can be measured by the number of times the student clicks on items such as a pop-up glossary or a recording for a read-aloud accommodation. Computer-based assessments and tools that measure the amount of accommodation-use could give insight into how much students are utilizing the accommodations, if at all. Researchers could use these tools in future studies to explore the relationship between the amount of exposure to an accommodation and use of the accommodation during tests and then make inferences on the way in which these factors influence test scores.

As stated by Rios et al. (2020) recommendations on assigning accommodations to ELs are minimal. A main factor that may lead to minimal and unclear guidelines is the need for evidence-based accommodations that show that accommodations are effective in making assessments more accessible to ELs. However, despite the issues with educators not having a clear set of guidelines on how to assign accommodations to ELs, the use of accommodations in ELs is increasing. Rios et al. (2020) mentioned that despite the inconsistencies, at least one test accommodation was assigned for the ELA and math sections across distinct state testing programs. Chia (2014) explains SBAC's application and use of several accommodations in their computer-based tests and summarized leading research for each accommodation. Researchers should ensure that results of their studies on accommodations for ELs can be accessed by test developers and educators so that guidelines based on the latest research can be created, shared, and implemented.

Are ELs one homogenous subgroup?

Recent research points out the fact that EL status is not permanent, in that students can place out of EL status and become reclassified as English proficient and thus transition from the "EL" to the "non-EL" subgroup (Saunders and Marcelletti, 2013). The fluidity of the EL classification can create misleading conclusions when ELs' progress on achievement tests is observed over time. The category of "ever-EL" may help move researchers and educators away from misleading conclusions. However, there are also a vast number of differences in students within those that are not English-only speakers which need to be considered.

The main issue with analyzing student assessment progress with only two EL subgroups, EL and non-EL, is that ELs with a higher English language proficiency (ELP) score become non-ELs, which leaves ELs with low ELP scores in the EL category and will result in misleading comparisons of the two groups over time (Umansky et al., 2017). This has proven to be an issue when analyzing performance gaps between ELs and non-ELs across grade levels. For example, as listed earlier, the performance gap on grade 4 math and reading tests were 24 and 33 points, respectively (NAEP, 2021a,c); however, if these scores are compared to the performance gap on grade 8 math and reading tests a 42-point and 45-point difference would be observed (NAEP, 2021e,f). A misleading conclusion when comparing ELs' performance gaps from grades 4 and 8 is that as ELs advance in school, the performance gap between ELs and non-ELs widens. However, this conclusion is based on the misleading assumption that the ELs in grade 4 and grade 8 are the same group of students with the same background characteristics—which is not the case since ELs can become non-ELs.

The ever-EL subgroup helps with the issue of misleading conclusions when a dichotomous EL/non-EL categorization is used. The ever-EL category groups ELs who have reached English proficiency according to their state's ELP assessment and current ELs (i.e., non-native English speakers who have not yet reached English proficiency on their state's ELP assessment). The ever-EL categorization does not separate non-native English speakers based on ELP scores, which gives more insight into how this group of students achieve academically on state tests and therefore, this categorization can be used when observing their progression on state-tests over time. Saunders and Marcelletti (2013) add that the EL/non-EL categorization can also decrease the chances of detecting positive improvements in achievements within non-native English speakers. For example, Betts et al. (2019) found that the percent of students that met or exceeded ELA standards on the 2018 SBAC test varied across EL groups (ever-ELs: ~45%; reclassified students: >60%; English only students: ~60%) especially when examining current ELs (>10%). Therefore, the ever-EL alternative breakdown of EL students challenges the narrative that ELs are low achievers, when in fact most EL students are placed into the non-EL subgroup as they advance in school.

Another reason why the dichotomous EL/non-EL categorization should be reexamined is because there is a vast amount of diversity within the EL population that could be influencing ELs' performance on content assessments. Sandberg and Reschly (2011) summarize that "low educational attainment and socioeconomic [SES] conditions of the family, as well as recency of immigration, often place ELs at increased risk for low achievement, poor educational outcomes, and limited economic opportunities." Sireci and Faulkner-Bond (2015) add that ELs also differ in their home language and level of literacy and education in their first language. Studies and reports that separate ELs into distinct groups show differences in assessment scores based on different variables like SES. For example, Luo et al. (2020) found that dual language learners from higher-SES backgrounds (which was measured by the level of education of students' primary caregiver) demonstrated higher language learning skills than dual language learners from lower-SES backgrounds. It is also likely that ELs' age of entry into the US school system influences their performance on statewide assessments, as they are likely to have lower levels of English proficiency. Also, it is likely that students who enter the US school system at a later age will face more developmental barriers to learning a new language like English than students who enter at an earlier age (Conger, 2009). Given that the EL population is so diverse, it is important to consider ELs' background when analyzing their content-based assessment scores.

Summary and discussion

In this chapter the authors reviewed research on elementary school aged ELs' performance on content-based assessments in the US and provided recommendations on how to improve the quality of assessments for ELs. First, the authors summarize the reliability, validity, and accessibility of state content assessments for ELs. Next, three issues related to the assessment of ELs were discussed including: unnecessary linguistic complexity; the need for effective, valid, and researched-based accommodations specifically adapted to assist the language needs of ELs; and the need for guidelines on assigning accommodations to ELs. The authors recognize vast improvements that have been made to assess ELs but also identify areas of improvement to make assessments more accessible and more accurately measure ELs' knowledge.

Literature on the assessment of ELs clearly show that this student group consistently underperforms when compared to their native English-speaking peers in almost all academic subjects (Abedi, 2015). However, the performance-gap between the two groups is more profound in content areas with higher level of linguistic complexity; that may not even be related to the focal construct (Abedi and Lord, 2001). Unnecessary linguistic complexity may have serious impact on the validity and reliability of content-based assessments for ELs, as it impacts on the content, construct, and concurrent validity indexes. Rios et al. (2020) mention that educational stakeholders should be cautious when drawing conclusions about ELs since language threats the reliability and validity of assessments.

By reviewing literature on the main language-based accommodations (such as first language translations, glossaries, read-aloud, and linguistic modifications), it is clear that mixed research results have made it difficult for researchers to provide educators with established recommendations or guidelines on which accommodations are best suited for ELs. The main way that assessments can be improved to be more inclusive of ELs is to provide research-based and effective accommodations that target ELs' limited English language proficiency. In addition to effective accommodations, educators should receive proper guidelines on the application and use of the accommodations so that they are equally accessible to ELs. When conducting research and analyzing results, it is important to consider that the EL category is not fixed and that ELs often become non-ELs as they advance in school. By considering differences between ever-ELs and current ELs, researchers can avoid making misleading conclusions about non-native English speakers. With these improvements, the performance gap between ELs and non-ELs can be minimized on statewide assessments in the US and, most importantly, ELs' content knowledge may be more accurately assessed and evaluated.

Assessment of young emergent bilingual children

The United States continues to experience dramatic increases in its cultural and linguistic diversity, including the burgeoning Latinx community (Bauman, 2017). Linguistically, Hispanic students constitute about 80% of emergent bilinguals in the US, who are children whose English language proficiencies are in its steps toward full proficiency (National Center for Education Statistics, 2022). Emergent bilingual (EB) children is a term that has become increasingly utilized to describe English language learners (ELLs; García et al., 2008), and used henceforth in this chapter. Emergent bilinguals (EBs) may have previously developed linguistic skills in another language before English, though this is not always the case. Comparatively, dual language learners (DLLs) is a broader term identifying children who may have varying levels of proficiencies within and across their languages, including potentially highly developed English proficiency.

The age of acquisition and rate of acquirement vary among emergent bilinguals, and are generally classified in two principal modalities: simultaneous learning or sequential learning (McLaughlin, 1984). Simultaneous learners are exposed to both languages early in life and sequential learners have undergone strides in their first language proficiency before learning the second language, typically upon entering school systems around the kindergarten years (Guzman-Orth et al., 2017). In the assessment field, measures and approaches are relatively more developed with school-aged sequential EB learners in comparison to their younger simultaneous EB peers. While the assessment landscape is rapidly broadening for EB infants, toddlers, and preschoolers, further developments are necessary as described in detail in this chapter.

Call for comprehensive assessments of young emergent bilingual children

Across educational and medical settings, screenings and assessments of emergent bilingual children are conducted to determine eligibility for a myriad of services and opportunities. These include prevention, early intervention, specialized instruction, and treatments (e.g., special education, targeted school-based English language programs, gifted and talented, magnet schools, therapies, and more). Appropriate and accurate screenings and assessments are imperative for young EB children due to their role in qualifying for supports, services, and interventions.

While language development is an essential consideration in the assessment of young emergent bilingual children, it is not singularly sufficient. Rather, a holistic understanding of young EB children is vital to accurately understand the progress and course of linguistic development (both within and across languages), along with development in other important domains. Even within a linguistically-focused assessment of young emergent bilingual children, there are differences in exposure, language usage, and proficiency that must be considered within the scope of a comprehensive assessment (Espinosa and López, 2007).

Indeed, young EB children are in fact children; they experience variation across their development much like other children. As such, full screenings and assessments across developmental domains are more likely to yield increased precise estimations of young EB children's functioning. Furthermore, they lead to more valid courses of actions in medical, familial, and scholastic settings (e.g., at the student-level for individualized plans, at the class-level for curricular decisions, and at the district-level for policy

determinations). Otherwise, there is both the risk, and the reality, of under- and over-identification of abilities and disorders (Bedore and Peña, 2008).

Fig. 1 below highlights key domains of comprehensive screening and assessment considerations for young Emergent Bilingual (EB) children. The first five are consistent with the central developmental domains of the Head Start Early Learning Outcomes Framework (U.S. DHHS, 2015): (a) linguistic and early literacy development, (b) cognitive development, (c) social and emotional development, (d) approaches to learning, and (e) physical development. The sixth and seventh domains reflect the examination of environmental features that consistently influence the development of young EB children: (f) family and early care experiences and (g) societal and policy contexts. Each of these domains is described below, with focus on expressly salient considerations such as the assessment of early linguistic and early literacy development.

Language and early literacy development

Engaging in multi-modal evaluations of young emergent bilingual (EB) children's language development is central for an accurate assessment (Lazewnik et al., 2019; Mancilla-Martinez et al., 2018). Well-established and empirically supported methods have been created that can, and should, be utilized when evaluating young EB children. These include parent and teacher reports, language sampling, nonword repetition, dynamic assessment, and standardized measures, among others.

Parent and teacher reports

Parent and teacher reports that are administered via questionnaires or interviews incorporate adult observations and knowledge of young children's linguistic skills and developmental trajectories. Assessment tools like the *Bilingual English-Spanish Assessment* (BESA; Peña et al., 2018) contain a parent interview section that can be used for this purpose. In turn, teacher reports on young children's language use have been developed to identify relative levels of linguistic proficiency and subsequent steps for bilingual assessment, such as language routing (Barrueco et al., 2017). In addition, the CECER-DLL *Child and Family and Teacher Questionnaires* incorporate both parental and teacher reports. It was developed with extensive input, feedback, and analysis from researchers and practitioners across the United States (Castro et al., 2020).

Monitoring vocabulary progress is also valuable for estimating the linguistic skills of young EB children over time, particularly since some aspects of academic development, such as reading comprehension, are linked to vocabulary development (Mancilla-Martinez et al., 2016, 2018). Among very young emergent bilinguals, measures are available to examine early expressive and receptive linguistic skills (including vocabulary), such as the *MacArthur-Bates Communicative Development Inventory* (CDI) and its Spanish counterpart the *MacArthur Inventario del Desarrollo de Habilidades Comunicativas* (IDHC) (respectively, Fenson et al., 2007; Jackson-Maldonado et al., 2013). Short forms have become validated and available over time, which facilitate their implementation across clinical, school, and research settings (Fenson et al., 2000).

Fig. 1 Key domains of comprehensive screening and assessments for young emergent bilingual (EB) children.

Observational approach

Language sampling is an observational approach that can additionally be incorporated in young EB children's linguistic assessment. Using this procedure, children's utterances, articulation, and communicative language are observed and documented by professionals. A wealth of information is obtained during language sampling regarding conversational and expressive language skills. However, it should not be used in isolation because it does not account for the broader repertoire of receptive language skills, which are critical foundations for language development among bilingually developing children (Lazewnik et al., 2019). As such, language sampling acts as a component within a broader system of linguistic measures, allowing for the analysis of bilingual children's language use.

Direct language assessment

To directly assess linguistic development through structured interactions with young emergent bilingual children, various approaches include nonword repetition, dynamic assessment, and the broader array of standardized measures (Lazewnik et al., 2019). Repetition tasks allow for the observation of phonological working memory among other components of language. The nonword method specifically has been suggested for emergent bilinguals because it does not necessitate advanced linguistic knowledge prior to testing (Archibald, 2008). In turn, dynamic assessment focuses on learning processes and its utility has been explored for language screenings among young EB children (Patterson et al., 2020).

Even in the midst of advancements among the measures described thus far with young emergent bilingual children, standardized norm-referenced measures comprise the most frequently utilized approach. In discussing standardized measures, it is important to examine frequently identified concerns that must be considered in selection, implementation, and interpretation of results. First, standardized measures historically were initially normed for English monolinguals and then used with young emergent bilinguals without even a basic evaluation of their linguistic, cultural and psychometric properties (see Barrueco et al., 2012). The practice of directly translating measures from one language to another while disregarding cultural and linguistic differences may even still be found among some measures today, yielding potentially invalid findings on children's functioning. As Mancilla-Martinez et al. (2018) describe, the extent to which cultural and social factors are incorporated in the development of measures must be considered when identifying whether specific assessment tools may be appropriate for application with specific children or communities. According to Bandel et al. (2012), specific facets to examine when reviewing and selecting measures for use with EB children include (a) the extent to which skills found across differing cultures are incorporated for the communities being assessed, (b) the extent to which the questions asked on the measures function similarly or dissimilarly across languages and cultures, and (c) the extent to which dialectical variations within one linguistic group, as the differences in pronunciation, vocabulary, or grammatical structures, are incorporated. Such characteristics should be carefully examined through a mix of advanced, rigorous quantitative and qualitative analyses and procedures. If empirical support is not evidenced, bias may be present in the measures (Bandel et al., 2012).

Second, there has traditionally been a scarcity of appropriately-developed standardized measures available in languages other than English for use with young EB children. Importantly, tremendous shifts have been made in the field, and the use of this argument to avoid crucial assessments with young EB children is no longer the case. There are indeed well-developed, normed measures, particularly in Spanish (e.g., Barrueco et al., 2012). What the field faces (and what young EB children face) is continued use of invalid measures, limitations in the creation and validation of measures beyond English and Spanish, and a scarcity of trained personnel to appropriately select, administer, and interpret assessments with EB children (Barrueco et al., 2012; Mancilla-Martinez et al., 2018). Critically, conclusions reached from poorly executed assessment approaches with young EB children may be inaccurate and harmful.

Third, the language proficiencies of the standardization groups can differ tremendously among culturally and linguistically validated measures. For example, some measures in Spanish are developed abroad in Spanish-speaking countries and/or with recent Spanish-speaking immigrants in the United States. On the one hand, such measures can facilitate an understanding of how strongly developed language skills in languages other than English are. On the other hand, it can reflect an assumption that bilingual children are fundamentally two monolinguals in one person (Grosjean, 1989). Further, the application of findings from populations who have markedly distinct monolingual language environments and experiences (including potentially different dialects) to the community of emergent bilingual children in the United States may be questionable. There is also acknowledgment that the languages within bilinguals are not inherently separated, as evidenced by emerging bilinguals code-mixing by using both languages in the same stretch of conversation (Genesee, 1989). Positively, assessment instruments are being created and norm-referenced specifically with young emergent bilingual children across the nation. These include, among others, the *Bilingual English-Spanish Assessment* (BESA; Peña et al., 2018) and the *Preschool Language Scales-fifth Edition, Spanish* (Zimmerman et al., 2012).

A related consideration in the standardization of measures for young EB children is whether they were developed to assess one language (such as Spanish or Japanese) or whether they are created to be administered bilingually (Spanish-English or Japanese-English). The latter, termed *conceptual scoring*, provides practitioners with information about children's skills across languages, which is critical when the questions at hand relate to the overall development of children's functioning in language, reading, or other domains. However, conceptual scoring does not yield specific information about the development of skills in each language, which is sometimes integral depending on the purpose of the assessment (Aikens et al., 2020). With conceptually scored measures, every item is designed and analyzed for their equivalence in serving as valid indicators of development at each stage of growth. A good example of the necessity of such analyses is evidenced in comparing monosyllabic words in English that are often present as early items on English measures (such as ball) relative to their more difficult linguistically counterparts in other languages (such as pelota in Spanish).

Literacy assessment

While language and literacy are intricately connected, young EB children can progress in separate rates across these two subdomains (see, [López and Páez, 2021](#) for discussion). That is, early literacy development may be more advanced in one or both languages compared to language development, or there may even be variation dependent on the specific language and subdomain (for example, low English and high Spanish vocabulary coupled with high English and low Spanish literacy). Such findings may be evidenced when comparing results to English dominant peers, and also reflect the composition of measures. Some early literacy measures focus on more discrete skills (such as alphabet knowledge and/or phonological awareness) relative to the linguistic processes involved in literacy assessments for older children (such as reading comprehension (e.g., [DeBruin et al., 2015](#)).

Given this state of the field and the rapid rate of linguistic and literacy development within and across languages early in life, it is advisable that the literacy assessment of young EB children be conducted in all their languages (rather than only one) in order to gather a complete perspective of their full literacy abilities and growth. Otherwise, assessing in one language will only provide information regarding literacy development in that singular language ([Aikens et al., 2020](#)). Conversely, using both languages provides fuller information about young EB children's literacy development, including specific words or phrases within and across languages ([Aikens et al., 2020](#)). Otherwise, potentially invalid inferences about young EB children's literacy knowledge and abilities may result.

Even so, it is important to acknowledge that, at times, assessments may only be able to be administered in one language due to limitations in resources, time, and other factors (when assessing literacy development and/or other domains; [Aikens et al., 2020](#)). In such cases, determinations are made to conduct assessments in the home language, English, or dominant language. Systematic decisions for identifying the appropriate language for evaluation should be made through parent or teacher reports or utilization of language screeners directly with young EB children ([Bandel et al., 2012](#)). Examples of measures utilized for language screeners include the *Woodcock-Muñoz Language Survey-III* (WMLS-III; [Woodcock et al., 2017](#)) and the *PreLAS English and Spanish assessment scales* ([Zimmerman et al., 2012](#)).

Cognitive development

As described at the outset of this chapter, a comprehensive approach across developmental domains is critical in the assessment of all children, including young EB children. If linguistic difficulties are occurring among young EB children, it could potentially reflect a broader cognitive or learning impairment. Further, if their languages are developing strongly, solely considering this aspect of development among young EB children might miss the demand for support in other domains, such as in the other aspects of cognition.

Within the Head Start Early Learning Outcomes Framework (ELOF), the cognitive domain reflects varying aspects dependent on age ([U.S. DHHS, 2015](#)). Among infants and toddlers, the cognitive subdomains focus on: (a) exploration and discovery, (b) memory, (c) reasoning and problem-solving, (d) emergent mathematical thinking, and (e) imitation and symbolic representation and play. In the cognitive assessment of infant and toddler EB children, indirect measurement through parent and teacher reports is often used. This includes measures such as the *Ages and Stages Questionnaire* (third ed., ([Squires and Bricker, 2009](#)), which is available in various languages (Arabic, Chinese, French, Spanish, and Vietnamese and others).

Among preschoolers, the ELOF cognitive subdomains reflect early academically-related processes, such as a) mathematics development (including counting, cardinality, operations, algebraic thinking, measurement, geometry, and spatial sense), and b) scientific reasoning (scientific inquiry, reasoning, and problem-solving). Assessing preschooler mathematical development (including that of young EB children) has often been comprised of indicator measures, including subtests from the *Batería IV Woodcock-Muñoz*; [Woodcock et al. \(2019\)](#). More detailed mathematical measures have also been created such as the *Research-based Early Mathematics Assessment- Short Form* (REMA-SF; [Dong et al., 2021](#)), and with attention to diverse communities (e.g., [Weiland et al., 2012](#); [Alkhadim et al., 2021](#)). Regardless of the specific measure, young EB children's mathematical skills may be underestimated if only assessed in English ([White et al., 2021](#)).

Strides have also been made in assessing scientific reasoning among young EB children, notably Spanish bilingual children. A federally-funded study is underway to create a Spanish adaptation of the *Lens on Science* measure, a computer-adaptive tablet-based science measure ([Greenfield, 2015](#)). *Enfoque en Ciencia* is being developed with bilingual samples across the United States including representation of varied communities and dialectal variations, as well as analysis of potential biases using item response theory analytic approaches (PI: Daryl Greenfield, Co-PIs Sandra Barrueco & Ximena Domínguez).

In recent years, early academic and developmental assessments at school entry through widespread benchmark testing has been gaining traction, including kindergarten entry assessments (KEA; [Ackerman, 2018](#)). If developed well and to its fullest potential and used appropriately with diverse communities, KEAs may be able to serve as state and national indicators of early childhood well-being and thus improve policy initiatives ([Kaminiski et al., in press](#)). Through this approach, school systems may also be able to create targeted practices that reduce educational gaps among young EB children by mitigating developmental and educational delays before they become prevalent. While promising, great strides must occur before widespread implementation of KEA assessments for young EB children, particularly in regards to cultural, linguistic, and psychometric properties ([Ackerman, 2018](#); [Kaminiski et al., in press](#)).

Social and emotional development

Relationships with adults, relationships with other children, emotional functioning, and sense of identity and belonging comprise the four subdomains of the ELOF across the infant, toddler, and preschool years (U.S. DHHS, 2015). Assessment of social and emotional development in early childhood often consists of parent and/or teacher reports (either through interviews or questionnaires). For young EB children, these can include measurement systems like the *Ages and Stages Questionnaires: Social-Emotional* (second ed., Squires et al., 2015), which are available in multiple languages and across ages. In addition, parent-report measures also include the *Brief Infant-Toddler Social & Emotional Assessment (BITSEA)* (Briggs-Gowan and Carter, 2006), which includes Competence and Problem scales and whose Spanish form has been utilized with young EB children in national studies (Caswell et al., 2019).

Among assessments that examine social and emotional development, there is a stark obligation to attend to linguistic and cultural considerations since there can be tremendous diversity in social norms and emotional expression (e.g., Leong et al., 2014). When considering peer interactions and interpretation of social behaviors, one aspect that may be uniquely relevant for young EBs is Theory of Mind (ToM). ToM refers to the ability to attribute beliefs, emotions, and intentions to another person or oneself, and it contributes to the understanding that others can have different mental states than oneself (Premack and Woodruff, 1978). From a socio-pragmatic approach, bilingualism may contribute to EB children's awareness about others' mental states due to their experience communicating with individuals who speak different languages (Goetz, 2003). Further, bilingual children may understand the possibility of different perspectives as they can express themselves using varying modalities. ToM and, relatedly, social reasoning, can influence children's estimation of others' behavior and can subsequently impact their reactions and behaviors. Measurement development assessing such processes among young EB children continues to make progress, such as with the Spanish version of the *ToMas-Child* (Rivas-Garcia et al., 2020). Among older EB children, a Spanish-language version of *Virtual Environment for Social Information Processing (VESIP-Sp)* is also currently undergoing validation across the United States (PI: Russo-Ponsaran, Co-Is: McKown, Wainer, Barrueco, Smith, & Huber).

Approaches to learning

The Approaches to Learning domain encompasses attention, exploration, and higher order cognitive processes within the Head Start Early Learning Outcomes Framework, with similar subdomains for infants, toddlers, and preschoolers: (a) emotional and behavioral self-regulation, (b) cognitive self-regulation (executive functioning), (c) initiative and curiosity, and (d) creativity (U.S. DHHS, 2015). This aspect of development has garnered extensive research in the bilingualism field over past decades, among the most of any domain outside of the language and literacy domain.

Indeed, the relationships between bilingual experiences, attention, and memory have been of keen interest (Bialystok and Werker, 2017). Bilingualism has been linked to executive function (EF) capabilities in children and conceptualized to influence the development of nuanced attentional strategies given the subtleties required to understand two languages (Bialystok, 2015). When selective attention is required, bilingual children have demonstrated elevated inhibitory capabilities (Bialystok, 2015). However, findings of enhanced executive functions, such as inhibition, appear more consistent when children have already developed high rates of bilingualism and less consistent among emergent bilinguals in the process of learning multiple languages with varied linguistic and life experiences (De Bruin, 2019; Paradis et al., 2021).

Among young emergent bilingual children, there is a relative dearth of validated measures of approaches to learning, especially for EB infants and toddlers. Furthermore, there are limited assessments available to examine the subdomains of initiative, curiosity, and creativity for children across all ages, much less young EB children. As this area of research continues and is promising for young EB children, measurement of the approaches to learning domain must advance.

Physical development

Overall health and physical development are important facets of early childhood, especially given the remarkable changes during this age period. Fine motor skills particularly play a role in expressive language development and language impairments and, as such, are critical to include in screenings and assessments of young EB children (Grissmer et al., 2010). Gross motor skills and physical health also provide a broad perspective on the general development of young EB children, including discerning whether any language difficulties may be reflective of systemic concerns that should be addressed and supported in a multisystemic fashion. Health (including dental health) and nutrition can be involved in language-specific and other difficulties, with disparities identified among EB children's families (e.g., Carter et al., 2022; Flores and Toman-Korman, 2008). Within the Head Start Early Learning Outcomes Framework, this domain is inclusive of perceptual, motor, and physical development (U.S. DHHS, 2015). Specific measures for screening and assessing physical development among young EB children can include parent and teacher report measures (such as the *Ages and Stages Questionnaire* in English and Spanish), as well as direct assessment of body-mass index through measuring height and weight.

Family and early care experiences

While the comprehensive assessment of young emergent bilingual children should incorporate the varied abilities within children (as described in the five domains above), it must not stop there. Rather, young EB children's development and experiences are best

understood with the contexts of their familial and early care settings. This includes examination of environmental contributors that influence developmental processes, such as exposure to and use of languages in the home and early care environments, formal educational levels, and socioeconomic resources (also termed external factors; see [Paradis et al., 2021](#)).

For example, the presence of a dominant language across two languages (where one language is more developed than another) is fairly typical in the context of the United States. Differing levels of proficiencies across two languages may not necessarily be indicative of children's inability to develop or sustain two languages. Rather, language dominance may be reflective of varying experiences across environments (e.g., school, home, community; [Paradis et al., 2021](#)). Importantly, imbalance does not necessarily imply language learning difficulties, impairment, delays, or even linguistic preference among young EB children. Even so, parents, teachers, and healthcare providers (including psychologists) are often concerned about young EB children's language development and assumptions must be avoided that any language delays or imbalance is solely due to external contributors. Instead, a thorough analysis of environmental factors and a full examination of children's development across various facets of functioning and over time is essential. Age of dual language learning and relative language proficiency should be assessed within the context of everyday language usage and switching patterns, though these have historically been difficult to accurately obtain ([De Bruin, 2019](#)).

Importantly, there have been strides in recent years in evaluating language exposure and use in both home and early care settings. Specifically, detailed parent and teacher reports have been developed, which are described in detail above within the language and literacy section. Further, wearable devices are available that capture language exposure and use (such as LENA), along with open-source automatic estimators of phoneme, syllable and word counts (e.g., [Räsänen et al., 2021](#)). However, continued developments in the accuracy of such devices may be warranted ([Marchman et al., 2021](#)). Finally, classroom observations of bilingual language use across individuals (child, teacher, assistant teacher, others), settings (large group, small group, individual), and purpose (instruction, non-instruction) have been developed through national studies, such as the *Cultural Items and Language Use (CILU) Checklist* ([Barrueco et al., 2017](#); [Bumgarner et al., 2019](#)).

Societal and policy contexts

The availability and use of effective assessments for young emergent bilingual children is further situated within societal and policy contexts. As indicated above, significant inroads have been made in the development of linguistically, culturally, and psychometrically validated measures, though continued advancements always remain. Even so, key issues persist in impacting effective emergent bilingual assessment at systemic levels. Among various factors, these include the availability of trained professionals, accessibility, policies, and funding. To understand the source of such barriers, it is informative to consider the historical and current policies pertaining to emergent bilingual children and their assessment. Young emergent bilingual children are members of the same societal and policy contexts as their school-aged EB peers and soon enter these educational settings for elementary school and beyond. Two notable policies are relevant: the Lau decision and Proposition 227.

First, the Lau decision of 1974 by the Supreme Court was a pivotal inflection point because of its directive in instructing language-minority students (another term for English Language Learners; [Ovando, 2003](#)). The decision stemmed from a case pertaining to the equality of education for nearly two thousand students who primarily spoke Chinese and experienced comprehension barriers to educational content. Citing the Civil Rights Act of 1964, this landmark decision provided greater educational access to bilingual children with the required provision of specialized support and services. Even with the subsequently passed Lau Remedies, some barriers for EB children have persisted due to inconsistencies in approaches to educating and assessing bilingual children, varied foci on distinct goals and outcomes, and isolation of some programs in schools and districts ([Ovando, 2003](#)).

The second notable policy influencing EB children and their assessment was Proposition 227, a Californian law passed in 1998 and later repealed in 2016. It dictated that language-minority students were primarily required to learn in English with minimal support of their home languages. It reflected an expanding societal focus on English language use to the exclusion of other languages in response to increased immigration ([Padilla et al., 1991](#); [Ovando, 2003](#)). States such as Arizona, Connecticut, Washington, and Colorado adopted similar laws. The implementation of English-only programs shifted the linguistic resources in classrooms for emergent bilingual students, as well as reduced the ability to collect accurate, holistic data about their academic progress across their languages ([Katznelson and Bernstein, 2017](#)).

What does this mean for the future of assessment for emerging bilingualism? Some scholars suggest that the assessment of emergent bilingual students is at the center of policy decision-making and is essential in determining the future of interventions and programs. A study conducted by [Poza and Viesca \(2020\)](#) examined the outcomes of a law requiring all students to reach English reading proficiency by third grade (specifically, The Colorado Reading to Ensure Academic Development Act). State-mandated English proficiency assessments (without similar implementation of assessments in other languages or across languages) were found to effectively serve as a means of limiting the incorporation of home language in instruction. These findings highlight the capability and power of assessments to determine programs and policies. It is important to note that double-testing in two languages can also create double-standards where bilingual students are held to a disproportionately higher standard than their monolingual peers in which they are expected to perform well academically in two languages instead of only one or across both ([Poza and Viesca, 2020](#)). This is an important consideration in schools where English proficiency is prioritized over general educational development and where bilingual development is not fully understood or supported. Nevertheless, implementation of assessments solely in English for emergent bilingual children can not only misestimate their development, they effectively change the practices and programs developed to facilitate their success.

Within the early childhood education system, policies have been enacted that support multilingual language use in familial and care settings. This is reflected in standards and recommendations comprised of educational, medical, and federal entities (e.g., McCabe et al., 2013; Head Start Early Childhood Learning and Knowledge Center, 2021; Oliva-Olson et al., 2019), and reflects the incorporation of research-based knowledge about bilingual developmental processes during the initial years of life. Relatedly, it has become mandated that all young EB children participating in Head Start programs across the United States must be assessed across their languages in order to comprehensively understand their development (U.S. Department of Health and Human Services, 2016). Influencing nearly a million young children a year and citing research on bilingual assessment (Barrueco et al., 2012), fiscal resources are provided yearly to programs to support the adequate implementation of full assessments for young EB children.

Conclusion

Impressive inroads have been made in the field of young emergent bilingual assessment, from the creation of measures across a range of domains and settings to the creation of national standards and policies. At this juncture, improvements in the availability and implementation of multilingual comprehensive assessments for all young emergent bilingual children remain, especially when it is well-established that assessments across domains, metrics, and languages is best practice (e.g., Lazewnik et al., 2019; DHHS, 2016; NAEYC, 2020). These consist of parent and/or teacher reports, language sampling and/or observations, along with linguistically- and culturally-valid and well-standardized measures. Comprehensive measurement approaches yield more accurate depictions of young EB children's development, especially if there is the possibility of impairment such as autism spectrum disorder or developmental language disorder. An essential component is the incorporation of multilingual measurement since assessment solely using one single language can lead to underestimation and misdiagnosis (Bandel et al., 2012).

Unfortunately, best practice has been hampered by limitations in training and availability of professionals with experience and expertise in this topical area. As such, the status quo is poised to continue where young EB children are assessed with inappropriate measures, inaccurate procedures, hastily translated measures by well-meaning professionals, or not assessed at all (Ackerman, 2018; Barrueco et al., 2012). However, this does not have to be the case nor should it be. Professionals themselves are calling for training advancements. For example, a nationally-representative study identified that over half of teachers and assistant teachers in Migrant and Seasonal Head Start indicated a need for additional training in bilingual development and about one-third of teaching staff across the United States called for additional training in assessment (Caswell et al., 2019).

Given that approximately 1 in 10 children in the United States are emergent bilinguals (and even higher proportions of 1 in 5 among some young EB populations), there is an obligation for all constituents to appropriately assess this substantial proportion of American children (National Center for Education Statistics, 2022; U.S. Department of Health and Human Services, 2006). Further, it is not the sole responsibility of any one system of care given the multiple and varied interactions young EB children have across settings. Health service professionals, early care and educational settings, and school districts are all primary systems that must be held accountable for accurately assessing young emergent bilingual children. Now is the time for universal training, standards, and policies for all professionals and across all settings to comprehensively and accurately meet the strengths and needs of young emergent bilingual children across the nation.

Introduction

In the last two decades, literacy has emerged as a central notion for guiding curricular and instructional decisions in foreign language (FL) programs in the US. This is especially at the collegiate level where calls for a paradigm shift have often been directly connected not only with critiques of the two-tiered curriculum that has long characterized them (e.g., Allen and Paesani, 2010; Kern, 2000, 2003; Maxim et al., 2013) but also broader conversations around supporting advanced FL abilities (e.g., Byrnes, 2005; Byrnes et al., 2010; Maxim, 2009). In this two-part essay, we offer a brief history of literacy focusing on the literacy turn of the mid-1990s and the move from literacy to multiliteracies in the first two decades of the 21st century and its contributions to the field of FL, and suggest new directions in FL multiliteracies that should shape research and practice going forward. To provide some context, we start with a snapshot of literacy in the early days of communicative language teaching.

From the mid-1970s to mid-1990s, several FL scholars (e.g., Phillips, 1978; McKee, 1981; Terry, 1989), in likely reaction to a persistent tendency to prioritize oral over written modes in communicative language teaching, called for a better integration of reading and writing into FL teaching which they argued should also be viewed as communication. At the time, literacy was primarily equated with reading and writing as separate cognitive processes and the ability to decode and encode texts in print, page-bound, official, standard forms of the language studied. Nevertheless, by supporting a view of FL reading and writing as communication, these early advocates set the stage for later, more multidimensional meaning-focused approaches to literacy (Paesani et al., 2016; Warner and Dupuy, 2018).

The second half of the 1990s witnessed a shift, with reading and writing being increasingly viewed as interconnected modes of communication. Whereas lexical and syntactic knowledge were often highlighted in early discussions on FL literacy, now greater consideration was given to the role cultural and textual schema play in both reading and writing and greater stress was put on the need to go beyond mere comprehension and functional use and foster analytic and interpretive abilities. The more integrative approaches of the 1990s would pave the way to later understandings of literacy not only as plural (as in multiliteracies) but also as social practice wherein identities, relationships, and world views are built (Gee, 1990).

Literacy in late 20th and early 21st centuries

The New London Group's manifesto and the literacy turn

In the years leading to the meeting of the New London Group (NLG), an international group of education and literacy scholars, and the publication of their manifesto *A Pedagogy of Multiliteracies: Designing Social Futures* in 1996, the understanding of literacy as reading and writing and the dominance of print modes over other modes of communication had started to be challenged in linguistics and educational circles. In the last decade of the 20th century, (a) the world was changing fast and literacy pedagogy in education needed to reflect the increasing cultural and linguistic diversity of the contemporary globalized world, (b) approach text genres as sites of unequal power relations, and (c) account for the new kinds of texts and textual engagement that had emerged in the wake of new information and multimedia technologies. With this shift in thought, greater attention would be paid to everyday literacy practices putting them on par or higher in value to academic literacy practices.

From the outset, the NLG's overall goal was twofold: (a) change what counts as literacy and literacy teaching, and (b) acknowledge the multimodal nature of literacy practices. In the jointly-authored framework they proposed at the end of their week-long meeting the NLG called for a multiliteracies pedagogy that recognizes the range of communicative modes used to make meaning in texts, encourages critical and social justice framing, and promotes engagement with design, technology, and multimodality.

The NLG's pedagogy of multiliteracies views language and other modes of communication as dynamic resources ("available designs") for meaning making which get transformed in dynamic acts ("designing") of re-presentation and re-contextualization as learners attempt to achieve their own purposes, thereby contributing new meaning resources ("the redesigned"). Three key aspects make this broader view of literacy and literacy teaching stand apart from earlier views: variability, agency, and subjectivity. Within this framework, meaning does not reside in texts, but is rather actively and dynamically made when learners creatively apply linguistic and other semiotic resources in interrelated ways with an awareness of "the sets of conventions connected with semiotic activity [...] in a given social space" (NLG, 1996, p. 74).

To translate the multiliteracies view of dynamic communication into the context of teaching, the NLG's framework proposes four pedagogical components (Situated Practice, Overt Instruction, Critical Framing, and Transformed Practice) which need to be part of the learning process, though not in any particular fixed order or as neatly separate foci. In Situated Practice activities, learners are guided to make use of their designed and designing experiences as they engage in textual meaning-making. In Overt Instruction activities, learners, with active instructor support, are introduced to explicit metalanguages so that they are better able to recognize and meaningfully describe the processes and patterns of Design. Critical Framing activities help learners connect particular Designs of meanings to their social and cultural contexts, and view and evaluate them critically in relation to their own contexts. Transformed Practice activities provide opportunities for learners to demonstrate their ability to apply reflectively the knowledge that they developed through Overt Instruction and Critical Framing activities, in other contexts or cultural sites and in new and creative ways "embedded in their own goals and values" (NLG, 1996, p. 87). Kalantzis and Cope (2000) underscored that Situated Practice is the point from which the other three pedagogical components depart but never leave behind and each of them "in its own way, expands the horizons of the lifeworld. Overt Instruction makes implicit patterns of meaning explicit; Critical Framing interrogates contexts and purposes; Transformed Practice takes meanings and subjectivity into new and less familiar domains" (p. 207). Overt Instruction, Critical Framing and Transformed Practice are "processes for 'denaturalising' the lifeworld, of making the everyday strange in order to cast new light on it and so as to have a more informed basis upon which to design both imminent meanings and our larger social futures" (p. 208).

Although the NLG's Multiliteracies framework was never more than a "statement of general principle" (1996, p. 89) for schools, their call for educators to acknowledge the diversity and, social and cultural situatedness of literacy has had a deep and lasting impact on FL teaching and learning. The work of this group's scholars along with the work of other scholars who also took a critical approach to literacy appeared at a time when the field of FL education was becoming less firmly anchored in theories of language acquisition and more interested in theories of language socialization (Steffensen and Kramsch, 2017). In the next section, we turn to the current state of FL literacy studies as it has developed in the early decades of the 21st century before finally focusing on primarily two directions that both research and practice should consider going forward.

FL multiliteracies post NLG's manifesto

Building on the NLG's manifesto as well as critical literacy scholarship, Kern's (2000) seminal book *Literacy and Language Teaching* offered both a rationale and a model for a more integrative approach to teaching FL written communication. For Kern, much like the NLG, literacy is not about "what texts mean in an absolute sense, [but] what people mean *by* texts, and what texts mean *to* people who belong to different discourse communities" (p. 2; emphasis in original). This kind of literacy, one that "[considers] reading and writing in their contexts of use, [frames] reading and writing as complementary dimensions of written communication, rather than utterly distinct linguistic and cognitive processes" (p. 2) can help FL learners develop deep communicative competence. For Kern this involves their ability to use linguistic and other semiotic resources in both critical and conscious ways. To facilitate this, FL teaching must be more deliberate in integrating critical framing and transformed practice as conceptualized by NLG across all curricular levels of FL programs, something that is still a work in progress as instructor-led, text-centered talk (usually around literary texts) that seldom allows for complex thinking in complex language largely continues to prevail (Mantero, 2002, 2006; Donato and Brooks, 2004) in this instructional context. The long-standing focus on skill-based literacy instruction and the entrenched belief that learners with lower communicative ability cannot engage in cognitively challenging tasks, explain why multiliteracies pedagogy has been slow to enter the FL classroom and why the existing gap between lower and upper division FL courses often continues to persist.

Expanding on his argument that FL Learners must develop a "critical and cultural understanding of language, literacy, and communication" (Kern, 2000, p. 134), Kern argued that a literacy-based approach could help bridge the perennial divide between lower-level and upper-level courses in FL programs (see also Parsons, 1985; Kramsch and Nolden, 1994), a point which was taken up again in the Modern Language Association (2007) report, which called for "a broader and more coherent curriculum in which language, culture, and literature are taught as a continuous whole" (p. 3). Following this report, numerous publications, primarily focused on curricular and instructional frameworks and the types of textual work that needed to be more actively promoted in the FL classroom, appeared. Scholars like Arens and Swaffar (2000) argued that the ACTFL Standards (National Standards in Foreign Language Education Project, 1996) could provide a framework to promote FL learners' literacy as a set of linguistic, cognitive, and sociocultural skills, while others argued that proficiency-oriented frameworks have limited potential for fostering an understanding of "what it takes to communicate capably across, or for that matter, even within cultures" (Warford and White, 2012, p. 401). It is for this reason that scholars like Crane (2006), Paesani (2006), Maxim (2009), and Troyan (2016) suggested a genre- and discourse-based orientation for re-organizing the FL curricular sequence so that it would reflect a social understanding of language use and add breadth and depth to it in the process.

A growing number of scholars have expanded the range of literacy practices in FL teaching far beyond the verbal to include visual texts such as graphic novels (e.g., [Elsner et al., 2013](#)), films (e.g., [Brown et al., 2015](#); [Dubreil, 2011](#); [Goulah, 2007](#); [Kaiser and Shibahara, 2014](#); [Kaiser, 2018](#); [Ryshina-Pankova, 2013](#)), images (e.g., [Sagnier, 2015](#)), posters (e.g., [Péron, 2010](#); [Ryshina-Pankova, 2013](#); [Wu, 2016](#)), photos (e.g., [Schmerbeck and Lucht, 2017](#)), and artwork (e.g., [Palpacuer-Lee, 2018](#)) in the classroom, arguing that the critical interpretation and production of different visual genres “enable learners to uncover prevalent representational motives, metaphors, and symbols in texts” ([Ryshina-Pankova, 2013](#), p. 164) and empower them “in their use of the target language and development of second language identities” ([Brown et al., 2015](#), p. 162).

As FL education is gradually moving beyond a proficiency-oriented view of communication, multiliteracies-oriented pedagogies offer a path forward to expand the goals of FL learning so that it takes in the “[r]eflection that accompanies interpretation and explores the diversity of interpretations, assumptions, perspectives, positions, expectations, and judgments, and includes reflexivity that turns one’s own experience into an object of critical examination” ([Leung and Scarino, 2016](#), p. 90). However, even as a large number of FL educators have embraced a design-based perspective on meaning-making, other aspects of the multiliteracies framework have often remained underemphasized, including an attention to translanguaging, social justice, and learner agency/subjectivity (see [Collier and Rowsell, 2014](#); [Warner and Michelson, 2018](#)). Writing from the context of US second language teaching and learning, Warner and Michelson argue that “institutional and disciplinary priorities of FL education, which are often framed tightly by and indeed identified through nationalist paradigms and dominant discourses, create constraints” (p. 12) which might explain why the dimensions of multiliteracies that are not readily tethered to proficiency and competence-oriented goals are often overlooked. Adopting broader and combined multiliteracies strands would demonstrate a commitment to the original ideas of NLG who understood multiliteracies more holistically.

In this next section, we examine several emergent and in many ways interconnected new research directions, which are beginning to expand the scope of multiliteracies in FL education and highlight important notions from the framework that have been overlooked by the field for a long time but are starting to emerge.

New and emergent directions in multiliteracies language education

Translingual literacy practices and social justice

Offered as a way to pedagogically respond to changing literacy practices and increasing linguistic and cultural diversity in an interconnected world, the NLG’s multiliteracies framework aimed to make literacy instruction more socially just by recognizing the validity of multiple languages, cultures, and means of expression and the many fluid and unpredictable ways in which individuals dynamically mix the languages and other semiotic resources in their repertoire when in contact situations of linguistic and cultural diversity particularly in digital spaces ([Cope and Kalantzis, 2013](#)) and form in the process new practices, meanings, and grammars which [Canagarajah \(2013\)](#) describes as translingual practices. Beyond this broadening of focus, the multiliteracies framework also promoted pedagogical shifts which called on bringing students’ out-of-school literacy practices into the classroom and, in doing so, expanding what “counts” as meaning-making in an academic context.

Translingual pedagogy is still very much in its infancy in foreign language education as it challenges commonly adopted departmental structures which tend to define programs and courses by the names of languages and sequenced proficiency levels, and the exclusive use of the target language policy. In programs whose *raison d’être* is defined by the names of languages (see [Kramsch, 2012, 2014](#); [Kramsch and Huffmaster, 2015](#)) instructors grapple with the need to reconcile the changing contexts of language use in a globalized world with the fostering of historical and cultural awareness through the study of one named language and culture. As a result, translingual practices in both in-person or digital environments remain under-applied and under-researched in this field and work is needed to better understand the role that translingual practices may have in FL pedagogy as “these modes of hybridity can be socially and rhetorically significant” ([Canagarajah, 2013](#), p. 10). By opening spaces wherein learners can use their entire semiotic repertoire and act as their translingual literate selves, FL teachers would engage in acts of social justice by making the learning environment transformative.

Social justice and critical literacy have always been central to multiliteracies pedagogies in the awareness they bring to the fact that texts are never neutral and that, as any forms of language use, whichever they are, they reflect the interests, purposes, and ideologies of their producers. More importantly, although less reflected in FL pedagogy, critical literacy pushes educators and students to “see themselves as active participants of social change, as learners and students who can be active designers—makers—of social futures” ([NLG, 1996](#), p. 64). Some FL scholars (e.g., [Glynn et al., 2014](#); [Phipps and Gonzales, 2004](#)) have argued that the FL classroom can be a locus for social transformation. The goal of modern language education, as argued by Phipps and Gonzales, is to foster the development of “linguagers ... ‘agents’ or ‘language activists,’ who engage actively with the world, and for whom language learning is a way of embarking on the risky business of stepping out of one’s habitual ways of speaking and acting in order to engage with others whose modes of speech and action are other” (cited in [Crosbie, 2009](#), p. 295). As the futures of individuals around the world hinge on decisions about social justice, multiliteracies pedagogies within FL instructional contexts have the potential to help learners bridge between analysis and action as they develop an awareness of how language shapes the very “misconceptions, untruths, and stereotypes that lead to structural inequality and discrimination” ([Nieto, 2010](#), p. 46).

Transmodal language pedagogies

In recent years, major organizations in the field of FL education (e.g. ACTFL/Partnership for 21st Century Skills; MLA) have started to promote an expanded view of meaning-making modes beyond the more traditional one which generally refers to the modalities of listening, reading, speaking, and writing and reflects a linguistic mode bias. The focus on the linguistic mode in this traditional view might be considered intuitive given the field's commitment to helping students develop the target language, but it has also served to perpetuate a longstanding tradition of logocentrism which is not reflective of an individual's repertoire of semiotic resources and the dynamic and complex ways in which they deploy them in their literacy practices. As put by Kress et al. (2014), the underlying assumption of such a view is that non-linguistic modes are "illustrative supports to the 'real thing'" rather than legitimate meaning-resources in their own right. Kress (2000) called on language educators to no longer "act as though language fully [represents] the meanings they wish to encode and communicate" while viewing other modes as "someone else's to look after" (p. 337).

With meaning-making resources other than linguistic ones featuring more prominently in recent conversations, and transmodal/translingual competence being a desired goal of foreign language education, FL programs are starting to embrace, albeit slowly, multiple modes and their use "in the design of a semiotic product or event" (Kress and van Leeuwen, 2001, p. 20), found in the types of visual media (e.g., graphic novels, films, videos, images, posters, and artwork) described in the previous section. More recently, many new literacy practices enabled by digital communication media have also begun to make their way in the FL classroom. In 2008, Thorne and Reinhardt suggested an approach that bridges not only the lower and upper levels of a language curriculum but also more academic genres with vernacular language, which is increasingly dominated by technology-mediated literacy practices. Similarly, Haffner, 2014 advocated for digital literacies to be embedded in existing language curricula and argued for extending the traditional range of genres and practices including informal, everyday practices that draw on the affordances of digital communication tools and demonstrate participants' use of complex semiotic systems. Reinhardt, Warner, and Lange (2014) and Warner and Richardson (2017) have demonstrated that integrating digital gaming and digital social media into a German genre-based multiliteracies course can help instructors and students view their engagement with texts within a larger nexus of social practices and discourses. Leier (2018), also in German, designed an Instagram-based, multiliteracies-oriented task which led learners to see themselves not only as consumers and borrowers of the social internet but also as contributors to, and thus part of, a virtual shared pool of knowledge.

In the current era of globalization of linguistic and cultural flows, digital communication media bring together ever-expanding audiences which engage in new configurations of communicative engagements and thus new literacy practices which are pushing FL educators to confront the transmodal/translingual realities of the contemporary communities in which learners are likely to participate such as Facebook (e.g., Androutsopoulos, 2014, 2015; Blyth and Dalola, 2016; de Nooy, 2017; Kulavuz-Onal and Vásquez, 2018; Oliver and Nguyen, 2017; Schreiber, 2015; Warner and Chen, 2017), fandoms (e.g. Shafirova et al., 2020; Zang and Cassany, 2016), or video games and their devoted online platforms (e.g., Hernández and Castaño, 2015; Lee, 2018; Reinhardt and Sykes, 2013). Findings from these studies demonstrate that these affinity spaces with their multimodal affordances and one-to-many communication offer an environment supportive of transmodal/translingual practices and "can raise learners' awareness of the dynamic and emergent nature of translingualism" (Blyth and Dalola, 2016).

Aesthetics and affect

Multiliteracies frameworks have expanded the scope of literacy in second language education beyond the kinds of transactional functionalism often found in proficiency-oriented treatments of texts; however, as education scholars such as Leander and Boldt (2012) and Pahl and Rowsell (2020) have also argued, there is a tendency toward hyperrationalism and artifactualization prompted by the design metaphor, which also assumes that people's purposes in engaging with texts are largely determined and goal-oriented. In their critical re-reading of the New London Group's manifesto, Leander and Boldt (2012) argue that, on the contrary, literacy-related activity is often not projected toward some textual end point but "as living its life in the ongoing present, forming relations and connections across signs, objects, and bodies in often unexpected ways" (p. 26). In his more recent book *Language, Literacy Technology* (2015), Kern has similarly argued that literacy pedagogy must become more relational and less object-oriented, by recognizing that much of meaning making is not in the texts themselves but in the invisible relations between things (see Kern, 2015, p. 222). This involves giving learners opportunities to not only analyze and apply the meanings designed into textual forms, but to engage with the ways texts move us and are moved through the world (e.g. Gramling and Warner, 2016; Warner and Gramling, 2013). This has also brought renewed attention to the role of aesthetics and affect in second language literacy development.

Scholars of language education (e.g., Risager, 2005; Kramsch, 2011; Kramsch and Nolden, 1994) have long emphasized the poetic and aesthetic dimensions of language and culture learning. While acknowledging that literacy practices are inextricable from the sociocultural contexts of their production and reception, these scholars have also pointed attention to the sensations, feelings, and emotions texts conjure in those who design meaning through and from them that are not necessarily directly connected to social interaction. Although affective response is understood by these scholars as attributable to the "richness and variety" (McRae, 1996, p. 19) of language and literacy more generally, there is also a case to be made through these more aesthetically attuned models for literariness in language teaching and learning. In this vein, some have argued that the "destabilizing potential" (Schultz, 2001) of literary literacy practices can draw learners' attention to the range of effects that particular design choices can have and enable them to "construct new/unknown meanings" (Tin, 2010, p. 216). Kramsch has argued for a central place for the "literary imagination" as a means of fostering symbolic competence and translingual/transcultural thinking (Kramsch, 2006, p. 251). Recent scholarship on

digital social annotated reading and viewing in foreign language contexts (e.g. Blyth, 2014; Thoms and Poole, 2017) has provided some valuable insights as to how learners engage with the aesthetic elements of texts, but further research is needed to understand what role literariness might have in the development of FL literacy. An initial study by Blyth et al. (2021) also suggests that meta-language that emphasizes literary and creative ways in which users play with language can help instructors in connecting concepts from meaning-oriented paradigms in language education to the design of pedagogical materials and learning experiences.

Conclusion

Just as other fields of education have been changed through shifting paradigms for understanding literacy and its development at the end of the 20th century, foreign language teaching and learning have been significantly impacted by the societal, technological, and pedagogical rethinking *multiliteracies* frameworks have attempted to capture. The pluralizing potential of the concept of *multiliteracies* has enabled scholars and practitioners to expand definitions of reading and writing, but beyond that it has created a term around which a range of different approaches that share in common a commitment to teaching languages as complex, dynamic systems for meaning making that intersect in practice with each other (translingually) and with other semiotic systems (multimodally). In this sense, multiliteracies pedagogies are helping language educators to further realize the meaning-oriented approaches to language teaching and learning that began to be conceived during the proficiency movements in the 1980s, by expanding the scope of what kinds of communicative resources receive space and attention in the language classroom.

At the same time, multiliteracies frameworks complicate familiar models of communication within FL education through the metaphor of design. Understanding language use and learning as the design of meaning highlights the reality that languages do not simply use new linguistic systems to manifest already formed thoughts, ideas, and feelings, but rather these ways of being in the world are shaped through the designs available, the agentful process of designing, and the ways in which we redesign ourselves and the world when we engage with them. As discussions of multiliteracies continue to develop and expand to better integrate movement between languages and modes and to recognize not only critical thinking but feeling, the pedagogies shaped through this work will also need to develop and adapt to social futures that are quite different from what the New London Group was responding to in the mid 1990s. Although it may be impossible to predict what kinds of social and technological realities language learners will encounter in their private and professional futures, we can safely assume that they will be called upon to engage with linguistic, semiotic, and cultural diversity that is multifarious and complex in all of the ways multiliteracies pedagogies have emphasized and conceptualized.

Introduction

What does it entail for foreign language learners to participate in their new language communities? What does it mean to be “literate” in their new social and cultural worlds? Literacy—or “reading and writing,” as it is more commonly referred to—in foreign language education is often conceived as “language skills” (i.e., decoding and encoding) that involve complex cognitive processes. Particularly in the field of teaching Chinese and Japanese as foreign languages that use non-alphabetic writing systems (i.e., Chinese characters), significant amounts of instructional time and effort are dedicated toward helping learners recognize, sound out, and memorize each character so that they can “decode” and eventually make sense of texts. The importance of scribing characters neatly and correctly is also emphasized, and learners are encouraged to place painstaking attention to the details of how to write each character. Participating in one’s foreign/second language communities, however, requires much more than decoding and encoding. It requires critical literacies—in its plural form, emphasizing that various types and forms of literacy exist—that allow one to recognize the sociocultural and political context of language use, as well as building one’s repertoire (skills and strategies) in negotiating one’s identity through shifting power relations. To be literate, learners must consider themselves capable of interpreting language in texts as a means of creating social relationships, as well as being able to produce knowledge in their communities.

Critical literacy is a pedagogical approach that focuses on the relationships between language, literacy, and power (Luke, 2012). Paulo Freire’s work on critical consciousness and critical pedagogy has had a profound impact on the advancement of critical literacy. In his book *Literacy* (1987), Freire (together with Macedo) wrote, “Reading the world always precedes reading the word, and reading the word implies continually reading the world Reading always involves critical perception, interpretation, and ‘rewriting’ of what is read” (pp. 35–36, emphasis original). In other words, we create meaning through dialogic negotiations between language (the word) and lived experience (the world), and the act of reading and writing is a creative act based on “a critical comprehension of reality” (1987, p. 157). For Freire, literacy serves to critically reflect on how language shapes our representations of our experiences and existing social orders. Thus, it allows us to imagine and transform the world (Giroux, 1987; Vasquez et al., 2019). Freire, strongly rejecting the “banking-model of education,” calls for a “dialogical approach” in which knowledge is recreated through self-reflection and dialog (Shor and Freire, 1987).

The idea of critical literacy that was originally developed in first language education has taken on importance in the field of teaching English as a second language (e.g., Alford, 2001; Case et al., 2005; Chun, 2009; Kubota, 2010; Lau, 2012; Luk, 2015; Luke and Dooley, 2011; Wallace, 2001, 2003; Weninger, 2018, 2020) and, more recently, English as a foreign language (e.g., Cho and Johnson, 2020; Huang, 2011a,b, 2012, 2013; Huh, 2016; Ko and Wang, 2013; Kuo, 2009, 2015; Lau et al., 2021; Lee, 2017; Lin, 2001; Mitsikopoulou, 2020; Motschenbacher, 2021; Romeo and Bobkina, 2021; Sibanda, 2021; Weng, 2021). However, its dissemination is still limited in the field of foreign language teaching, with some exceptions: Ludewig (2017) and Ryshina-Pankova (2013) in German; Fabbian and Carney (2018a,b) in Italian; Férez Mora et al. (2022) and Verma (2008) in Spanish; Kene-man (2015) in French; and Chikamatsu (2021), Doerr and Kumagai (2014), Gyogi (2019), Iwasaki and Kumagai (2008, 2020), Koyama (2016), Kumagai (2007, 2020), Kumagai and Fukai (2009), and Kumagai and Iwasaki (2011) in Japanese.

In this chapter, I take on the question of what critical literacies mean for foreign language learners who are already “reading” the world in their first language. Why do we need critical literacies in one’s additional language? What can we do to nurture learners’ critical literacies in their new language? Sharing examples of classroom projects that were designed according to critical literacy principles and carried out with US college students, I attempt to shed light on what critical literacies look like in learning Japanese in a foreign language classroom.

Shifting focus from “mere literacy” to critical literacies in foreign language education

Traditionally, literacy is understood to constitute cognitive abilities and individual skills for reading and writing printed materials (Reagan and Osborn, 2021). In most foreign language classrooms, written texts are used in assisting students’ language learning. Written texts are viewed as sources of “language data” (Alderson, 1984; Devitt, 1997; Elley, 1984), are used for “language exercises” (Alderson and Urquhart, 1984; Bernhardt, 1991; Elley, 1984) such as examining grammar and vocabulary (and Chinese characters or *kanji*, in the case of Chinese and Japanese), and are used to practice oral decoding (Grabe, 1991).

Oftentimes, the goal of reading instruction, regardless of the linguistic level, is to develop students’ abilities to accurately retrieve information from texts (Wallace, 2003). It is assumed that there is one correct interpretation of a text that is agreed upon by native speakers of the language. This emphasis on literal comprehension, rather than on interpretive or evaluative reading practices, is particularly marked in Japanese (and Chinese) instruction due to the perceived challenges that their writing systems present to those whose primary language is alphabet-based (e.g., English) (Iventosch, 2012; Lin, 2012). Writing, particularly at the beginning level, is often reduced to exercises to demonstrate a student’s mastery of writing systems, as well as their use of vocabulary, grammar, and mechanics. The accuracy of the form is strongly emphasized, much more than the meanings that students try to convey with their new language.

Cope and Kalantzis (2000) call such literacy “mere literacy” (p. 5), which focuses solely on “language”—usually a singular national language—that is thought of as a static and stable system divorced from its context. In contrast, sociocultural and critical perspectives consider the situatedness of literacy to be of the utmost importance. Literacy—reading, writing, and talking around texts—only makes sense if and when it is understood within historical, sociocultural and political contexts (e.g., Barton, 2007; Barton et al., 2000; Gee, 1987/1991; Street, 2014). Furthermore, from the sociocultural and critical views of literacy, the notion a “text” does not limit itself to just “language.” It includes multimodality—such as colors, images, sounds, use of space, and so on—which is an integral part of meaning making (Kress, 2000). Particularly with the advent of internet-based communication, it is immensely important to consider other semiotic systems to be part and parcel of what constitutes a text.

Critical literacies focus on the power relations that writers create through the use of language in texts. They use linguistic analyses—both the micro features of texts and the macro conditions of societies—to help readers develop “critical language awareness” (Fairclough, 1992). Critical language awareness constitutes an awareness of how writers choose particular linguistic/semiotic devices to shape messages for particular readers in order to accomplish certain goals. No language choices are accidental; writers consciously (or sometimes subconsciously) make selections of words, grammars, and discourses from available resources to produce, reinforce, and challenge certain ideologies and struggles for power. Critical literacies “empower learners by providing them with a critical analytical framework to help them reflect on their own language experiences and practices and on the language practices of others” (Clark and Ivanic, 1997, p. 12). Furthermore, they can be used to analyze how the classroom, text, or conversation is related to broader social, cultural and political relations (Pennycook, 2001), as well as how texts and discourse practices are constituted in order to maintain the status quo (Anderson and Irvine, 1993). To critically engage with texts requires self-reflection, which leads to interrogating taken-for-granted concepts (e.g., Kubota, 1996; Pennycook, 2001; Wallace, 2003). Critical engagement also encourages learners to consider ways to innovate and appropriate language uses for their own purposes. Finally, it aims to make learners conscious that all texts—textbooks included—implicate their writers’ values and worldviews, and that texts’ presentations of reality, including linguistic rules, are always partial and interested, and thus always open to contestation (Brodkey, 1996).

Teaching linguistic norms and conventions is important because they are used as gatekeeping devices. Without knowledge of these norms and conventions, students could be marginalized and denied access to the mainstream target society (e.g., Delpit, 1995; Freire and Macedo, 1987). However, as Baynham (1995) suggests, rather than teaching and learning “the discourse conventions of the dominant culture because they are there and ‘given,’ uncritically,” it is important to teach and “learn these conventions critically and strategically as a means of gaining access to powerful discourses and their benefits” (p. 242). Explicit discussion of the social origins of conventions such as “correctness” or “appropriacy” allows students (if they choose, and when the risk is not too high) to contribute to the ideological work of challenging and changing the conventions that work against values, beliefs, social groups, and the ideas with which the students identify.

Shifting the focus of foreign language teaching from dispensing knowledge of linguistic rules and training learners’ skills development—mere literacy—to critical literacies that foster learners’ agency and their ability to critically interpret wider texts (i.e., the world), foreign language education can play a critical role in contributing to the advancement of a more equitable social order (Janks and Vasquez, 2011; Reagan and Osborn, 2021).

Critical literacies in foreign language education

Oftentimes, developing critical literacies has been considered to be outside of the purview of foreign language education (for a review of this discussion, see Comber and Simpson, 2001; Wallace, 2003). Some argue that any critical analysis of texts needs to wait until the learners have well-developed linguistic knowledge (e.g., Bernhardt, 1991), while others argue that the process of acquiring linguistic knowledge and developing critical language awareness is an interdependent process (Hammond and Macken-Horarik, 1999; Luke, 1995; Wooldridge, 2001). Kubota et al. (2003) argue that the educational goal in any field, including foreign language instruction, is to encourage students to think critically in order to transform society by making it more equitable. In

a foreign language classroom, students' proficiency, the curriculum goal, and each instructor's beliefs may influence how critical literacy practices can be brought into the curriculum. Nevertheless, the critical outlook should be incorporated at all levels of instruction.

Undoubtedly, critical engagement with texts is a challenging task for foreign language readers, since they read texts written for an audience and community to which they most likely do not belong (Kramsch, 1993; Wallace, 2003). They need to interpret the text from both the writer's and the target reader's viewpoints, as well as from their own and their familiar communities' perspectives. While engaging in critical literacies in foreign language may be a challenge, foreign language learners have an advantage over those who are monolingual speakers/readers. Equipped with multiple language and cultural repertoires, such learners can bring to their literacy practices their rich knowledge and perspectives from different societies, cultures, and languages. Such resources are invaluable assets, allowing learners to compare multiple perspectives, to notice discrepancies or blind spots, and to recognize that what is considered "normal" in one linguistic/cultural practice is not necessarily universally so.

Through critical literacy practices in foreign language, learners begin to recognize that what is written in a text is not indisputable fact, but rather the author's views or interpretations of an event as shaped by a particular ideology. Being mindful and extremely cautious toward such textual politics is especially crucial for foreign language students because they tend to have "an overly deferential stance" (Wallace, 2003) toward authentic foreign language texts, due to their subjectivity as "learners" of that language. Recognizing the choices that textual authors make so as to accomplish their purposes via particular linguistic/semiotic devices is an important step for learners; such students can then become active agents in their own worlds, choosing specific words for their desired purposes. By drawing upon and negotiating diverse linguistic resources, learners can also play a mediating role between languages and cultures—a role that is not possible for monolingual individuals (Iwasaki and Kumagai, 2020; Kumagai and Iwasaki, 2015).

Critical literacies praxes in Japanese language classrooms

In this section, I introduce summaries of three classroom praxes that I have designed and implemented into Japanese language curricula. "Praxis," according to Freire, refers to theory-based action/action-based theorizing (Shor, 1999). Each project, based on the learners' linguistic levels, has different foci, yet all are guided by critical literacy principles and are aimed at nurturing learners' critical language awareness and agencies as multilingual speakers who are willing to take part in making societies more equitable. The critical language awareness that I emphasize takes into account the following aspects: (a) diversity of languages, (b) diversity of interpretations, (c) reexamination of taken-for-granted ideas, (d) fluidity and hybridity of languages, and (e) co-constructed relations of language and ideology. The first two examples that I will provide are projects that were incorporated into existing textbook-based curricula: a *Katakana* Project for a beginning-level course and a Linguistic Landscape Project for an intermediate-low level course. The third example is designed for intermediate-high to advanced level students who have begun reading various types of authentic texts.

Before I introduce the projects, I will describe some features of literacy in Japanese that are of particular importance to students who are engaging in critical reading of texts. Japanese language has three distinctive orthographies: *hiragana*, *katakana*, and *kanji*. These systems (along with the Roman alphabet, called "*romaji*") are all used in typical Japanese texts. *Hiragana* and *katakana* are sound-based, phonetic scripts called syllabaries, and both have 46 symbols (See Fig. 1). Some of the symbols are manipulated to represent other sounds by adding one of two small diacritics at the top right corner—for example, は (ha) becomes ば (ba) and ぱ (pa).

Hiragana						Katakana					
	a	i	u	e	o	a	i	u	e	o	
-	あ	い	う	え	お	ア	イ	ウ	エ	オ	
k	か	き	く	け	こ	カ	キ	ク	ケ	コ	
s	さ	し	す	せ	そ	サ	シ	ス	セ	ソ	
t	た	ち	つ	て	と	タ	チ	ツ	テ	ト	
n	な	に	ぬ	ね	の	ナ	ニ	ヌ	ネ	ノ	
h	は	ひ	ふ	へ	ほ	ハ	ヒ	フ	ヘ	ホ	
m	ま	み	む	め	も	マ	ミ	ム	メ	モ	
y	や		ゆ		よ	ヤ		ユ		ヨ	
r	ら	り	る	れ	ろ	ラ	リ	ル	レ	ロ	
w	わ				を	ワ				ヲ	
-n	ん					ン					

Fig. 1 Hiragana and Katakana chart.

The other system, *kanji* (Chinese characters), is a meaning-based script where each character represents a concept. It is said that there are approximately 10,000 *kanji* in use (Taylor and Taylor, 2014); however, the government's current script policy (updated in 2010) lists 2136 *kanji* as “*joyo kanji*”, or commonly used *kanji*. In practice, 3000–3500 *kanji* are needed to read texts such as newspapers, advertisements, etc., and to function as a literate member of Japanese society (Gottlieb, 2005; Seeley, 2000).

Each writing system has some normative rules: *kanji* is used for content words, *hiragana* primarily for function words (case markers and verbal/adjectival suffixes), and *katakana* mainly for foreign-origin words. Nevertheless, a writer has some freedom in their choice of orthography. For example, *manga* (Japanese comic books) can be written in *hiragana* (まんが), *katakana* (マンガ), *kanji* (漫画), or even *romaji* (Manga), and each choice evokes different images and effects (Dahlberg-Dodd, 2022; Kunert, 2020; Robertson, 2017, 2021). For example, reading experiments conducted by Ukita et al. (1996) revealed that when Japanese readers see the *kanji* word for *isu*, chair (椅子), an image of an old-fashioned, strongly build chair is usually generated, while the *katakana* (イス) generates an image of a modern, elegant chair, and the *hiragana* (いす) is associated with a simple wooden chair (in Iwahara et al., 2003, p. 393). Fig. 2 shows adjectives that were provided most frequently by native Japanese university students who were asked to write down any attributes that they associated with each script (Iwahara et al., 2003).

Hiragana	soft, round, tender, simple, childish, feminine, lovely
Katakana	angular, hard, cold, simple, new, sharp, inorganic
Kanji	hard, difficult, intellectual, vigorous, old, masculine, formal

Fig. 2 Adjectives association with each script type. Adopted from Iwasaki and Kumagai (2015, p. 212).

Similarly, in Fig. 3, Smith and Schmidt (1996) give the following stereotypical assumptions that native Japanese readers associate with each script choice.

	Writer/Reader features	Stylistic features
Hiragana	female, young	softness, femininity
Katakana	young, especially male	modernity, pop culture
Kanji	male, middle-aged and older	erudition
Romaji	young, especially female	commerciality

Fig. 3 Stereotypical assumptions for each script type. Adopted from Iwasaki and Kumagai (2015, p. 212).

In addition, there exist words from three types of vocabularies for a (nearly) identical referent: native Japanese words (*wago*), Sino-Japanese words (Chinese origin) (*kango*), and loanwords from Western languages (predominantly English) (*gairaigo*). For instance, a “hotel” can be referred to as *yadoya* (宿屋), *ryokan* (旅館), and *hoteru* (ホテル), respectively. Similar to the choice of orthography, choice of vocabulary evokes different images of both the reference and the writer (e.g., social status, sophistication). According to Kikuchi (1994), the images of hotels generated by each vocabulary type are “nostalgic, outmoded, simple, plain” for *wago*, “simple, plain, familiar” for *kango*, and “modern, luxurious” for *gairaigo*.

The writer’s choices for these features (among other things) communicate not only the ways in which they present themselves (Robertson, 2017, 2021) and perceive the audience (Dahlberg-Dodd, 2022), but also—and perhaps more importantly—illuminate their unspoken ideologies and/or worldviews that are implicated with such choices.

Katakana project: questioning authoritative knowledge presented in the textbook

Focusing on the three writing systems that exist in Japanese, having students investigate the authentic use of scripts—particularly, that of *katakana*—is a meaningful way to introduce students to critical literacy practices that can be accomplished at the beginning level. The *Katakana Project* was carried out as a short-term project (about 2 weeks) in the second semester of a first-year Japanese language course (for details, see Kumagai, 2011).

Overwhelmingly, Japanese language textbooks explain that *katakana* is used for foreign loanwords (e.g., Banno et al., 2021; Nagara, 1990). For example, the textbook that I use in my beginning-level Japanese course describes the use of *katakana* as “normally used for writing loanwords and foreign names” (Banno et al., 2021, p. 20). Less frequently, some textbooks include other usages of *katakana*, such as for onomatopoeic words (Makino et al., 1998; Tohsaku, 2006) and for words the author wishes to emphasize (Tohsaku, 2006). However, as mentioned above, the choice of writing system is context-dependent and involves the writer’s meaning-creating processes. Accordingly, the *Katakana Project* was designed to question textbook explanations of the rules, and to promote students’ awareness about contextual use of writing systems by having them collect samples of *katakana* words from

real-life texts. By extension, the project aimed to nurture students' critical attitudes toward any authoritative writings, including those found in textbooks (see for details, Kumagai, 2007; Doerr and Kumagai, 2014).

Students were instructed to find various uses of *katakana* in their personal lives (e.g., food packages, *manga*, magazines, movie/CD covers, internet sites, etc.) and think about the possible reasons for and effects of its use. They found an abundance of *katakana* words that deviated from the "normative" rules described in the textbooks, and noticed that the use of *katakana* does not automatically mean that words written in it are foreign loanwords. They found *katakana* used for writing proper nouns (name of places, persons, and companies), animals and plants, onomatopoeia, slang and invented words, and for emphasizing different accents/enunciations of Japanese words uttered by foreigners (and even by space aliens!).

To illustrate the unconventional use of *katakana*, two examples that students brought to class are shared here. The first example is a Japanese poster of a Hollywood film, "Resident Evil: Extinction" (released in Japan as "Biohazard III"). The poster has a picture of the heroine holding guns in both hands, and behind her is an apocalyptic scene with a burning sky. On it, the name of the movie (バイオハザード, Biohazard) and the name of the actress who plays the heroine (ミラ・ジョヴォヴィッチ, Milla Jovovich) are written in *katakana*—normative uses of the script. What is not normative is the word "サヨナラ" (*sayonara*, or goodbye) written in *katakana* above the heroine's head. Since it is a Japanese phrase, it would normally be written in *hiragana* (さよなら). The use of *katakana* instead of *hiragana* evokes a sense that the word was spoken by the heroine (i.e., a white woman) with some foreign accent.

Another example is from a package of strawberry candies. On the package, four words are in *katakana*: "サクマ" (*sakuma*), which is the name of the company; "ギュ" (*gyu*) and "キュン" (*kyun*), both of which are onomatopoeia; and "スゴい" (*sugoi*), an adjective meaning "great", which is written in a combination of *katakana* (for the stem) and *hiragana* (for the suffix)—a highly unconventional way of scribing the word. Normally, the rules dictate that the word "sugoi" is written in *kanji* followed by *hiragana* (凄い), or, if catering for children who do not know that *kanji* yet, it could be written exclusively in *hiragana* (すごい). The use of *katakana* in place of *kanji* captured the student's attention and curiosity. This type of "script play", only possible for languages with multiple writing systems, allow writers to be creative in communicating various feelings and nuances.

Students interpreted the effects of non-conventional *katakana* usage as making it "stand out," evoking a sense of "modern", "cool", "light-hearted", etc. They noticed that factors such as genres (e.g., *manga*, fashion magazines, advertisements, newspapers, academic books, snack packages, etc.), the writer's background and identity representations (e.g., authoritative, erudition, young, hip, etc.), and the target audience (e.g., children, adults, general public, scientists, etc.) shape the choice of scripts. Through in-class discussions, the students also discovered that while these choices are guided by the writers' various intentions, interpretations of these works differ depending on their readers' backgrounds and worldviews. For example, scribing a foreigner's Japanese utterance in *katakana* was interpreted by some students as "discriminatory," as it highlighted "wrong pronunciation," whereas those who think that speaking English symbolizes "modern" and "intelligence" thought that such transliteration was "cool." By engaging in the project, the students realized the fluidity of meaning conveyed by script choice and also began to recognize the arbitrariness of rules and norms (Kumagai, 2007). As one student wrote in her reflection paper, "I noticed that there are many cases where *katakana* was used besides for *gairaigo* [foreign loanwords]. But before the project, I did not think about the reasons for such cases. Now, when I see *katakana* words, I want to know: Why is this word written in *katakana*?" These types of questions and ensuing discussions do not impede students' mastery of basic rules and norms; rather, they spark intellectual curiosity.

This project, questioning authoritative presentations of knowledge, does not suggest that we do away with the standard textbook explanations of writing systems. However, it is important to keep in mind that simplified rules in textbooks—aimed at avoiding confusion—can sometimes constrict a learner's potential and creativity. Oftentimes, judgment as to whether some use of language is correct or not is based not only on its alignment with rules, but also on who the author is (Bourdieu, 1991). Some uses praised as language play or creativity if done by native speakers may be viewed as an error if used by learners.

Linguistic landscape project: engaging in dialogical negotiations to uncover taken-for-granted assumptions

The Linguistic Landscape Project, which took advantage of linguistic landscapes—"words and images displayed and exposed in public spaces" (Shohamy and Gorter, 2009a, p. 1)—as sociocultural texts, was implemented in a fourth semester (the second semester of a second year) Japanese language class as a semester-long project (for details, see Kumagai and Takahashi, *in print*). Previous studies that used linguistic landscapes as resources for additional language learning discuss various educational effects, ranging from language forms (i.e., writing systems, vocabulary, expression, grammar) (Leung and Wu, 2012; Rowland, 2013; Sayer, 2009) to pragmatic competence (Cenez and Gorter, 2008; Chern and Dooley, 2014; Rowland, 2013), symbolic competence (Shohamy and Waksman, 2009b), multicompetence (Cenez and Gorter, 2008; Rowland, 2013), critical language awareness (Dagenais et al., 2009), and multimodal literacy skills. Importantly, all of these studies highlight that the use of linguistic landscapes in language education offers a learning context for students to critically engage with texts.

The linguistic landscape project provided students with an opportunity to analyze issues such as what languages and other semiotics are used on signs, what function(s) each of them plays, what such signs suggest about the community, and what power relationships among the different languages can be extrapolated through a critical "reading" of signs in Japan. Ultimately, its aim was to help students understand how language is integrated within broader social structures; this was achieved by exploring actual language-in-use, and, subsequently, by imagining ways to transform society so that it becomes more inclusive and equitable for all.

When there are no nearby areas where students can experience Japanese linguistic landscapes (as was the case for this project), Google Street View can offer an alternative way for students to virtually explore streets in Japan. In groups of two or three, students

chose a city, virtually walked down the street, and selected (and took screenshots of) several signs that captured their interest, including several that they deemed to be incomprehensible. They then engaged in multiple levels of analysis of each sign using a modified version of the “Four Resources Model” of critical literacy (Freebody and Luke, 1990): (a) decoding and describing, (b) meaning making, (c) evaluating and critiquing, and (d) transforming (see Kumagai and Takahashi, *in print*). Students, in their original groups, completed several assignments: their findings were presented in class, an analytical essay was composed, and members created a multimodal page on WordPress. The various groups’ pages then became community resources for other Japanese language learners. In the process, students became “language detectives” (Sayer, 2009) and “urban geographers” (Malinowski, 2010) with agency as “investigators,” not merely “learners.”

The project adopted the dialogical approach (Shor and Freire, 1987), incorporating group discussions, multiple class presentations with feedback, and multiple check-in meetings with the teachers as significant parts of the learning process. It provided both students and teachers with an opportunity to engage with diverse interpretations, leading all participants to recognize their own blind spots concerning socioculturally sanctioned norms.

Fig. 4 shows a public sign posted by the Tokyo Metropolitan Police Department on a busy street in Tokyo. It alerts drivers that the road would be closed to the public in case of an earthquake. Significantly, this sign has been brought to class every time the project was conducted. What makes this sign so intriguing for students?

Students always ask why there is an illustration of a fish on the emergency sign. This simple question leads to a class discussion which illuminates that the connection between earthquakes and catfish (as told by a Japanese folktale) is a sociocultural one. This made “native” Japanese teachers recognize the problem of using such a culture-specific drawing on an official warning sign, as it excludes certain groups of people. Further discussion revealed that a more fundamental issue that prevented students from understanding the sign was the use of a cute illustration (be it catfish or anything else) on official signs, which is a normalized cultural practice prevalent in Japan. One student stated, “I thought it was funny because this is like ... a pretty serious sign, like you know, emergency sign that everyone needs to see. And it’s just like a fun little cartoon. [...] it wouldn’t make sense because like in America, all the emergency signs are just text and no pictures.” Her words underscored the difference in sociocultural expectations for what emergency signs should look like in Japan and the US.

The analysis of linguistic landscapes affords diverse interpretations, since the signs’ intentions may not be always explicit. For example, regarding the sign discussed above, it is not clear why the sign maker decided to put an illustration of a catfish, which occupies more than half of the space on the sign. What does the smiling catfish communicate with the viewers? Does it help to get a person’s attention? Isn’t it too distracting for people to actually read what is written? These discussions put teachers and students on a level playing field, allowing all to become collaborative partners who seek new knowledge. These discussions destabilize and transform the dichotomous relationships between teachers/learners, native/non-native language users, and knowledge-providers/knowledge-seekers. In the process, we are able to make visible the invisible assumptions that each of us hold, are reminded that what is normal to some is not necessarily so for others, and are able to recognize and appreciate diverse interpretations.

The project also led some students to pay attention to power struggles among different languages in Japan. For instance, a pair of students, both of whom were also studying Korean language at the time, investigated linguistic landscape in a Korea Town in Osaka, Japan. Korea Towns are areas where *zainichi* Koreans reside. *Zainichi* Koreans are ethnic Koreans with roots to the Korean peninsula during Imperial Japan’s colonization. They are also one of the ethnic minority groups in Japan who have been subjected to various forms of legal and societal discrimination, despite their permanent resident status in Japan. Taking advantage of their multiple languages as resources (i.e., English, Japanese, and Korean), they started exploring the streets with a simple question: Why are

Fig. 4 Emergency road sign.

some words written in Korean while other words are in Japanese? Seeking answers to the initial question led them to pose further questions: Why were Japanese translations provided for Korean phrases but not the other way around? Who are the signs trying to cater to, and what are their intentions and purposes? These inquiry-based explorations made them recognize that the use of Korean language on store signs was not necessarily for transactional purposes, but rather was used as design to capture the attention of potential customers. In contrast to the abundance of Korean scripts inside the Korea Town, the public signage across the street from the area that called to “Keep Rivers Clean” was only written in Japanese. This gap made them recognize an implicit message of assimilation policy by the Japanese government. Consequently, they decided to transform the “River” sign by redesigning it with translations in Chinese, Korean and English, as well as providing *furigana*—a reading aid, consisting of smaller *hiragana*, to indicate its pronunciation—for *kanji* words so that even children would be able to understand the sign. They wanted their new sign to reflect the community’s diversity, and to be more inclusive and helpful for the needs of everyone who lives there.

Focusing on how and why different languages are used in the analytic process, the students came to recognize the marginalized status of the Korean language in Japan’s official discourse, which is reflective of the *zainichi* Koreans’ position in Japanese society. This further made the students think critically about their own lives and led them to recognize linguistic injustices in their own communities. One student remarked that:

It’s funny because before this project, I’ve never considered [linguistic injustice] in America But look at things in the critical light in Japan, and in America which is more diverse than Japan, signs still tend to be in English. When I come across with the signs in Spanish, I take note of it because, I’m like, “that’s not usual.” I’m from [a] really white area But because I live in a neighborhood that’s very liberal so there are all sorts of signs saying like, “you are also our neighbors” in English, Spanish, and Arabic, because these are hot bun issue[s] around immigration. And it was just interesting to me because all those languages are only utilized when making a political point or stand, but then in everyday life they really aren’t So it made me think about that critically to my own life.

Problematizing and questioning what seems to be normal and ordinary would make the students aware of issues such as power struggles between different languages and unspoken political and sociocultural intentions behind semiotic choices (e.g., languages, words, illustrations, etc.). The experience that students gain from projects such as this one allows them to understand Japanese language and society on a deeper level, not to mention potentially making them more aware of their familiar surroundings.

Comparative reading of newspaper reports: shuttling between languages to become linguistic mediators

By taking advantage of students’ language and cultural repertoires as multilingual language users, creating a context where they can actively engage in “shuttling between languages” (Canagarajah, 2013) or “translanguaging” (Garcia, 2009; Garcia and Wei, 2014) in a foreign language classroom has significant benefits in developing their critical literacies and nurturing their agency as linguistic/cultural mediators (for details, see Kumagai and Iwasaki, 2015).

This unit, comparative reading of newspaper reports, was designed for intermediate-high to advanced level learners (Iwasaki and Kumagai, 2015), who have started reading texts beyond those in the textbooks. In this unit, students read two Web-based newspaper articles about the same event: one published by *The New York Times* (www.nytimes.com) in English (“4 American teenagers arrested”) and the other by *Asahi Shimbun Digital* (www.asahi.com) in Japanese (“米兵の子4人を殺人未遂容疑で逮捕” [4 children of American military arrested for attempted murder]). The event involved American teenagers from an American military base in Japan who allegedly strung a rope across a road, toppling a Japanese female motorbike rider and seriously injuring her. Crucially, the articles differed in terms of the sociopolitical and cultural background knowledge presumed of the target readers. Such differences led to differences in the writers’ selection of information and linguistic resources, which may give readers vastly different impressions and ideas about the reported event.

Three class sessions were spent on the unit. In the first session, students engaged in pre-reading activities by reading the article in *The New York Times*. They summarized the event in Japanese, using a list of keywords provided by the instructor. In so doing, the students familiarized themselves with the event and with new vocabularies that they needed in order to discuss the incident in Japanese, as well as to read the aforementioned Japanese article.

The students were also given a set of reading questions, and were instructed to read the *Asahi* article at home. During the second session, the students discussed the textual features and content of the *Asahi* article, using the reading questions as a guide. The questions guided students to pay attention to textual features such as sentence-ending modality and the use of direct quotes; the questions also helped them to achieve general comprehension of the article’s content.

In the third session, the students discussed their analyses of the text in depth, particularly paying attention to the effects of language choice on the reader. For example, the effect of the use of causatives was discussed by comparing two sentences: one containing causative predicates (i.e., “made [the woman] topple”; “made [her] get injured”) and the other containing active intransitive predicates (i.e., “[the woman] toppled over”; “got injured”). The students also compared the information included in the two articles, as well as the effect of the inclusion (and exclusion) of a given piece of information on the respective readers. For instance, while *The New York Times* article included a mention of a boy having sought help from a passer-by for the injured woman, the *Asahi* article contained two rather conflicting statements (in the form of direct quotes) made by two of the four teenagers (one stating that the rope stringing was done without the knowledge of the other two; the other stating that the action was decided by all four). The

Asahi article also included a drawing of the accident site, illustrating how the rope was strung. At the conclusion of the unit, each student was instructed to write an email message to her imagined Japanese friend, whose American colleagues only read *The New York Times*. The task was to inform the friend that her American colleagues' impression of the episode may differ due to the way the event is reported in *The New York Times*.

In class discussions, the students readily interpreted and independently realized that the purpose of each article was shaped by the readers' interests assumed by the writer, which consequently affected the details and types of information included in each article. In addition, the students noticed that the wording in the headlines and the use of quotes had created different impressions regarding the seriousness of the incident ("a bad image about Americans" in *Asahi*; just "kids [are] messed up" in *The New York Times*). The classroom interactions demonstrated that students were actively constructing meaning using their knowledge of both English and Japanese. As for the discussions regarding the use of causatives, the students articulated that while the sentence without the causative described the event as though it was "an innocent accident," the one with the causative highlighted the intention behind the (evil) act done to the woman who had no control over the incident. They recognized how a certain grammatical structure choice (in this case, causatives) evoked different nuances and images, and communicated different messages to the readers.

During the individual interviews conducted after the course was over, students' awareness of three key areas was identified. First, students recognized how different sociocultural perspectives (such as histories and experiences) are reflected in the ways news articles are written. Second, students realized that there is no clear line between "facts" and "opinions" in news reports. One student noted that even though an article may appear to be a non-biased, objective reporting of the news, it can in fact be biased by the writer's perspectives—"opinionated," to use the student's word—marked by a choice of words and grammatical structures. Third, when asked about the roles that they could potentially play because of their ability to read in multiple languages with an understanding of multiple cultures, most of the students considered their own roles to be significant. They demonstrated a growing awareness that they could play the role of mediators for those who do not have the ability or a desire to go beyond their language or cultural boundaries.

Summary of praxes

The three praxes described above all share important features. First, they all encourage students' explorations of real-life language use. The explorations and ensuing examinations are guided by the students' own interests and curiosity. The role of the teachers is not to provide answers (as they do not have them), but rather to ponder and engage in the inquiry with the students. Second, all three praxes focus on students becoming sensitive to the choice of language (and other semiotic devices). Why are particular choices made? What factors motivate such choices? What effects do the choices have on readers (including the students themselves)? Do you feel comfortable with a worldview represented and a position you are placed in by such choices? If not, how can we change them? Inviting students to engage in such dialogs is immensely important, allowing them to more fully understand the language and consequent social order.

Third, these praxes value students' multilingual and multicultural resources, as well as other knowledge and experiences (academic and otherwise) they possess, by encouraging them to actively enlist such resources during the learning process. Traditionally, the monolingual approach has been the norm in foreign language classrooms, and the use of languages other than the target one is strictly prohibited. However, strategic use of multiple languages, and allowing students to shuttle between languages as people normally do in real life (Canagarajah, 2013; Garcia, 2009; Otusji, 2019, etc.), is necessary for enabling students to fully engage in critical inquiries and meaning making (Kato and Kumagai, 2020; Kumagai and Kono, 2018). Encouraging students to draw on their knowledge of languages/cultural resources, and guiding them to pay closer attention to the semiotic choices in texts, can lead them to the analytical disposition that "seeks to uncover the social interests at work, to ascertain what is at stake in textual and social practices" (Janks, 2010, p. 12).

Fourth, the praxes provide a space for students to relate to communities outside of the classroom in various ways. The *Katakana* Project and the Linguistic Landscape Project both disseminated knowledge to the communities of other Japanese language learners by creating tangible products. The comparative reading unit, which tasked students with writing a letter to an imagined friend, made them recognize the important role they could play in society as linguistic/cultural mediators—a role I hope they take seriously and embody long after they leave the classroom.

Conclusion

The advent of internet and mobile devices has brought us unprecedented access to information and means of communication. It allows us to access information of all kinds almost instantly, from every corner of the globe. It also provides us with platforms and opportunities to participate in the creation and dissemination of information. At the same time, however, it bombards us with a flood of information, some of which is reliable, some of which is not. In the US, the age of disinformation facilitated by social networking systems brought about distrust and attacks on the mainstream media. People are living in an echo chamber of their own beliefs, creating a world that is gravely divided. Critical literacies—abilities to question and assess the legitimacy of information, to seek alternative interpretations by reflecting on one's own viewpoint as well as other's perspectives, and to imagine and work toward creating more equitable societies—are in great need, now more than ever.

Critical literacies in foreign language learning provide learners not merely with functional skills, but also with the conceptual tools that allow them to critique and engage with society. They assist learners in appreciating and recognizing the social contexts of language use, particularly with respect to the roles that language plays in establishing and maintaining power relations in society (Reagan and Osborn, 2021). The development of critical literacies in foreign language has profound implications because it allows learners to look at their world from multiple perspectives and equips them to voice concerns informed by alternative viewpoints. Learning a new language, and thus seeking to understand (and to become) the “Other,” requires humility and empathy, a disposition that is extremely important in this diverse and increasingly divided world.

Introduction

Language policy and planning (LPP) is an intervention into a language ecology in order to influence some aspect of language learning or use. As an intervention it shapes the language ecology in particular ways in order to address particular problems or to achieve particular goals. In shaping linguistic ecologies, decision-making about languages is inevitably consequential for the whole language ecology (Mühlhäusler, 2000); for example, promoting one language in education has consequences for other languages, which be marginalized in the planned ecology as a result of increasing space and attention being allocated to the promoted language. Language ecologies are by their nature diverse and linguistic diversity is the normal state of most larger social groups and even very small social groups such as families. LPP is thus an intervention into linguistic diversity and it often has as its objective simplifying this diversity, for example by declaring a particular language, or a small set of languages, as being the norm for various social functions, whether these are the work of government, the use and learning of languages in education, or other communicative needs. This chapter will examine the ways that LPP has impacted on linguistic diversity in societies by considering how LPP is consequential for societal and individual multilingualism, but before doing this will consider the nature and scope of LPP as a field of scholarship.

The scope of language policy and planning

In traditional LPP research it has been conventional to view the scope of study in terms of the actions of governments or governmental bodies, and research has taken the form of examining policy texts, language laws, education laws and other formal declarations (Ricento, 2000; Taylor-Leech and Benson, 2017). More recently, LPP scholarship has come to recognize that decision-making about languages exists at other levels than government and takes forms other than texts and has sought to develop a critical perspective on decision-making about language and the ways in which such decision-making reflects, reproduces, and enacts of power, ideology, and other social processes. As a result LPP scholarship has seen a movement away from the idea that language problems can be identified by objective processes and has recognized that identifying an aspect of language learning or use as problematic is highly subjective and influenced by ideological, attitudinal, economic and politic interests (Liddicoat and Taylor-Leech, 2020). This has led to an increased focus on the effects of policies, and particularly on the negative effects that policies could have on non-dominant groups (e.g., Pennycook, 1994). As LPP research has come to consider the subjectivity of decision-making, it has also come to recognize that such decision-making is not the unique preserve of macro-level institutional structures, but rather is distributed through societies and that multiple actors are engaged in decisions at different levels in society. This thinking reflects Foucault's (1975) recognition that power is something that is multivalent and distributed and applies such thinking to understanding the ways that various actors intervene in linguistic ecologies to shape how languages are used and learned. As a result, LPP research has come to focus attention on different levels of society in which decisions are made that are consequential for understanding languages and their ecologies, identified as macro, meso, and micro levels (Baldauf, 2006; Kaplan and Baldauf, 1997).

While initial thinking about these levels seemed to assign these layers to particular actors—e.g., the macro-level equates with governmental language policy actors, the micro-level with local communities, and the meso-level with intervening institutions, Liddicoat (2020b) has argued that is more appropriate to consider them in a contextualized way: the macro-level as the topmost level of language policy that is relevant in a context, the micro-level as the most local level in the context and the meso-level as any intervening levels. Moreover, there has been recognition that language policy is not simply a top-down process in which macro-level actors create policies that are then transmitted to lower social levels for implementation, but rather involves the potential for either top-down or bottom-up processes, or combinations of these, as in the case of "language policy from below" (Alexander, 1992) where the direction of influence is from the micro to the macro.

There has also been a shift in thinking about what constitutes language policy within LPP work, recognizing that texts (language laws, language policy documents, etc.) are just one aspects of the ways that decision about languages are represented in societies. In particular there has been a recognition that language policies can be seen in discourses about languages and their use (Liddicoat, 2013; Lo Bianco, 2005), which may occur in many different formats, and which play a profound role in shaping what happens in language learning and use. This involves a recognition that LPP is profoundly ideological—it is an encapsulation of systems of belief about languages—that are transmitted through discourses and ultimately shape language ecologies (Liddicoat, 2020a). Moreover, it is also possible to understand language policies by examining the language practices of a social group (Bonacina-Pugh, 2012, 2020). Such practice represented enacted language policy and reveal the often-unarticulated norms and conventions that shape actions. This movement has been accompanied by an growing interest in covert aspects of language policy (Shohamy, 2006) and the ways these impact on language learning and use. While language policy texts are typically overt statements about languages, attention is coming to be focused increasingly on covert aspects of policy; that is, the tacit norms, beliefs, attitudes, etc. that influence how languages are learned or used, or the silences that can be found in articulations of policy that can be as consequential for languages and their speakers as explicit statements.

The positioning of multilingualism in language policy

As language policy is an intervention in language ecologies and language ecologies are constellations of multiple languages within a social space, language policy is an important site for understanding how ideologies and practices of language use play out. In particular, language policy represents enactments that construct the social world of languages in particular ways (Gee, 1994). The discussion below will consider some of the key issues that are involved in understanding the nature of language policy interventions and how such interventions structure or restructure the language ecologies on which they act. In particular, it will consider how language policy engages with linguistic diversity and so creates particular understandings of the nature and meaning of diversity.

The normalization of monolingualism

When decisions are made about language learning and use in multilingual settings, linguistic diversity is often perceived as a problem that needs to be resolved by reducing the diversity of languages, at least in public domains (see also Ruiz, 1984). One particular focus of interventions in language ecologies since the Enlightenment has been the desire to achieve a unification of language and nation; what has been called the one-nation-one-language ideology (Ducard, 2016). While this ideology can be traced to earlier periods, notably the Reformation, it emerged strongly during the French Revolution as part of its rationalist nation-building agenda that argued for a single language for the French state on two grounds (Geeraerts, 2003). The first was pragmatic and focused on the democratic aims of the revolution: linguistic diversity as perceived as a barrier to communication that would prevent them from understanding their social rights and obligations and limit their ability to participate equitably in the society. The second was symbolic and based on the idea that a single language would create and represent a single, unified identity. The first rationale for linguistic uniformity requires dissemination of a common language, but not inherently at the expense of other languages. The second sees linguistic diversity as inimical to the unity nation-states and therefore requires diversity to be replaced by uniformity. Although this ideology has not always framed the articulation of policies and some nation-states such as India or South Africa have adopted multilingual policies, the ideas of effective communication and national identity have frequently guided policy decision-making in most contexts either overtly or covertly.

Overt articulations of the desire for linguistic unity can be seen in cases such as the language policy of Franco's Spain or in the treatment of Kurdish in contemporary Turkey. In Spain, languages other than Spanish (e.g., Basque, Catalan and Galician) were proscribed in public domains and restricted even in private contexts (Vallverdú, 1991). The government removed the languages from the cultural sphere, closed newspapers, forbade their use for naming children, for commerce and even in telephone conversations (Ben-Ami, 1991). While proscriptions of everyday language use are more difficult to police, the use of the spoken languages was stigmatized, and constructed as unpatriotic: *Si eres español, habla el idioma del Imperio* ["If you're Spanish: speak the language of the empire"]. In Turkey, language policy related to Kurdish has been articulated in the context of antiterrorism laws passed in 1991. Under this legislation, disseminating separatist propaganda was deemed to be a terrorist act, and promoting the use and learning of Kurdish was constructed as a form of separatist action because it undermined the linguistic unity of the Turkish state and thus its political unity (Liddicoat, 2018b). The nature of such separatist propaganda was very loosely interpreted; for example, Muller (1996) reports that including the mention of Kurds or Kurdish in a newspaper report could be understood as separatist propaganda. Such responses can be seen as extreme formulation of the idea that a single language is required to create and express a national identity. Proscriptive approaches to the use of languages can also be seen at a micro-level in the practices schools have adopted in relation to students' language use that involve sanctioning the use of the languages as deviant behaviors. For example, in 19th and early twentieth century France, students using a minority language were exposed to ostracism and ridicule through the use of the *symbole*—a token that students were forced to wear if they were heard using their home language in school. The particular power of the *symbole* was that students needed to police their peers' language practices as they were freed from the *symbole* only

by passing it onto another (Guillore, 2018). In a more contemporary context, Spernes (2012) reported that in some Kenyan schools, “students may be physically punished” (p. 190) if they use their home language in school, except in their mother tongue education classes.

In reality most LPP work aiming toward linguistic uniformity is less strongly linked to the proscription of languages and articulates the desire for uniformity through statements that support the sole use of another language, such as in statements in constitutions that a language is the official language of the nation-state. Such formulations usually do not explicitly mention other languages, but nonetheless serve to constrain possibilities for their teaching and use. For example, the designation of French as the language of the republic in the French constitution prevented France’s ratification of the European Charter for Regional or Minority Languages because the sorts of state support for minority languages envisaged in the Charter were seen to be inconsistent with the idea of French as the sole language of the nation (Roger and de Bres, 2017). Such restrictions are not simply legalist interpretations of official decisions about language but rather are direct consequences of intervention in linguistic ecologies; any attempt to consolidate or increase the place of one language in a linguistic ecology inevitably has consequences for the other languages of the ecology. Claims of centrality for one language in a society simultaneously relegate other languages to more peripheral positions.

It is not only overt policies stated in texts that relegate languages to peripheral positions. Such marginalization can happen even in contexts where there is no overt policy promoting a single language but where discourses about languages and language practices naturalize monolingualism. Such discourses and practices often center around the idea of the utility of speaking a single national language and thus reflect the pragmatic rationale for a monolingual practice discussed above. For example, in Australia, where there is no declared official language, English has been constructed as a pre-requisite for participation in the economic, social and political life of the country. This ideological position has a certain rationality; in a highly monolingual public context, access to the sole legitimate language of public has significant advantages (Bourdieu, 1982, 2001). However, the discourse of the utility of English is accompanied by a monolingual habitus (Gogolin, 1994) that sees monolingualism as the normal and default linguistic state of persons. Within a monolingual habitus, multilingualism is seen as a deviation from the norm and often as a threat to obtaining the language capabilities required to participate in that norm (Liddicoat, 2017, 2018a). Thus, for example, the dismantling of bilingual education for Aboriginal students in the Northern Territory was undertaken in order to improve students’ levels of English. Aboriginal students who speak English as an additional language are regularly found to have lower levels of English than the white, English-speaking peers (Devlin, 2017) and this situation was problematized as creating lesser economic and social opportunities and as creating less access to English-dominated, White Australian society. Studying in a child’s indigenous first language was constructed as time not spent learning English and therefore a constraint on the learning of the dominant language of the society and a direct cause of lower English language levels. In such ideological positions, multilingualism comes to be constructed as a polar opposite to normalized and desirable monolingualism and as a problem for participating predominantly monolingual societies. Multilingual education can thus be terminated as a way of “improving” educational provision.

This conflictual construction of multilingualism can be seen in many other contexts, such as in the practices of naming groups who do not speak the dominant language of the society in which they live, study or work. For example, the term Limited English Proficiency (LEP) student constructs such students in terms of a deficit in a single language in their repertoire and claims that this limitation is more relevant for understanding the student than their abilities in other languages. Similarly, terms that seem to indicate a recognition of linguistic diversity, such as Culturally and Linguistically Diverse (CALD) or multilingual speakers of English, often reflect a discourse that normalizes monolingualism in a particular language. CALD people are not positioned simply as people who participate in linguistic and cultural diversity but as being external to a linguistically and culturally “non-diverse” norm. Similarly, multilingual speakers of English are not any person who speaks a language (or languages) in addition to English but rather as those who do not speak English well because they speak other languages. Thus, a person who is a first language speaker of English but also speaks other languages as additional languages does not qualify as a multilingual speaker of English. The following quote is representative of the ways the term is used, even in discourses that are sympathetic to those denoted by the term:

What these standards do ensure is that learners of English and multilingual speakers of English are discriminated against in their access to education in countries like Australia and Britain since they need to meet particular English language requirements not required of the monolingual speakers of English in these countries

McAlinden and Zagoria (2013, p. 32).

According to this quote, multilingual speakers of English are subjected to discriminatory practices in education because they are required to meet conditions that are not set for monolingual speakers. In reality, the distinction is not between monolingual and multilingual speakers of English, but between those who speak English as legitimate speakers and those who do not. The terminology here adopts a discourse that normalizes monolingualism and problematizes multilingualism and precludes the possibility that a first language speaker of English can also be multilingual. In this way, a statement that has as its purpose the critique of native-speaker privilege in education settings has transported into the discussion as a heteroglossic act a set of ideological assumptions that normalize a monolingual habitus.

Hierarchies of value

In any language ecology, not all languages are equal and language policy both reflects and constructs hierarchies of value (Liddicoat and Curnow, 2014) in which the various languages present in the ecology are positioned relative to others according to certain valued dimensions. These hierarchies are pervasive in the language practices of a society and have a particularly significant impact on language policies in educational contexts. These hierarchies of value connect with Bourdieu's (2001) idea of the linguistic marketplace. In the linguistic marketplace, linguistic capital, which Bourdieu sees as a form of cultural capital, is exchanged, and different languages and language varieties have different symbolic values based on the connotation the linguistic variety holds. Thus, a language that is connoted as useful, prestigious, etc. holds more value in the marketplace than one that is not. In the linguistic marketplace standard language varieties and dominant languages enjoy greater value than non-standard varieties and non-dominant languages. The highest value in the market is associated with legitimate language, which Bourdieu defines as the language spoken by elites—cultivated circles, or those in power, and serves as a tool not just for communication but also for social distinction. The hierarchies that result from the differential valuing of languages and language varieties provide a context in which decisions about language are made and thus serve to structure interventions into language ecologies.

Such hierarchies of value can be seen at play wherever language policies select languages for specific focus. For example, in Australia in the 1990s, the Australian Language and Literacy Policy (ALLP) proposed a policy of funding eight "priority languages" to be chosen by each State and Territory from a list of fourteen languages: Aboriginal languages (counting as one language), Arabic, Chinese, French, German, Indonesian, Italian, Japanese, Korean, Modern Greek, Russian, Spanish, Thai and Vietnamese (Liddicoat, 2013). This policy thereby constructed an administrative and financial hierarchy for languages that had both symbolic and practical dimensions. Symbolically, the policy designated some languages as important by listing them as priority languages and others as less important by passing them over in silence. The fact that not all of these symbolically supported languages would receive funding created a further dimension to the hierarchy in which some languages received both practical and symbolic support, others received symbolic support only while the majority of languages, including most languages of immigrant communities, received neither. The particular formulation of priority languages used here is the result of a political process that revealed contestation about the ways languages were given value in the prestigious context of a policy document. The discussion paper on which the policy was developed proposed reducing the number of designated languages in the previous policy by omitting Modern Greek. This omission was largely associated with a change in the criteria for determining the value of languages within education. In earlier policy, a number of criteria had been used including both cultural and economic criteria. The ALLP, however, framed language learning as being entirely for economic goals and the value of languages was understood in terms of their potential contribution to economic outcomes. Modern Greek, which as a strong community language had a high cultural value, was not identified as a language which had economic significance for Australia and so was not considered to be a suitable target for educational funding (see, for example, Stanley et al., 1990). The omission led to significant political reaction from the Greek community, who sought to maintain the symbolic recognition of their language (Sussex, 1991). The resulting fourteen language list can be seen as a compromise in that it preserved aspects of the symbolic valuing of some languages, but by requiring a selection from the list for funding purposes reinforced more utilitarian valuing based on economics.

The Australian example shows that hierarchies of value can create controversies in language policy where competing criteria for determining value exist. Such hierarchies can also be reflected in other types of tensions and conflicts. This can be seen in the case of medium of instruction policy in Hong Kong, which is controversial and contested area of language policy. Hong Kong is officially trilingual in Cantonese, English and Putonghua and biliterate in English and Chinese, although the majority of the population speaks Cantonese as a first language (Poon, 2019). In Hong Kong's LPP, Chinese-medium instruction as the default educational setting, and Chinese can be used through the whole of education from primary to tertiary level, although most universities in Hong Kong are English-medium institutions. The policy is thus to give students access to education in their home language; however, community pressure for English-medium instruction has been significant and continues to increase (Poon, 2013, 2019). One of the main pressures against Chinese-medium instruction is a perception that English is a more valuable language than (Cantonese) Chinese and that Chinese-medium instruction is a less effective way of developing English (Evans, 2011). In discourses about language and education, Chinese and English are thus in conflict and use of Chinese is seen as the use of a less valuable language that is taking time away from a more useful language. Similar controversies can often be seen in contexts where educational policies seek to introduce local, non-official languages into education. Usually such policies are introduced to address students' difficulties in learning in a language that they do not know and so have sound educational objectives, but may be resisted by local communities who see the use of children's first languages in education as a threat to their acquisition of more powerful and thus more valuable languages. Lopez (2008) reports that in Latin America indigenous communities may resist bilingual education models because they believe that such education will continue to marginalize indigenous children by limiting their acquisition of Spanish. They also believed that, because their languages and cultures have not been valued in mainstream society, educational programs that use them are aimed at limiting indigenous people's access to Spanish and thus work to ensure that indigenous people have less access to contexts in which they could challenge majority group power. Thus, in this case, the pre-existing hierarchies of value in relation to Spanish and indigenous languages constructed interpretative frameworks that saw education as cementing such hierarchies rather than challenging them. Thus, the ideologies of value that attach to languages together with an idea that languages are in competition in education can mean that the space available to less "valued" languages may be highly contested (Liddicoat and Curnow, 2014).

Hierarchies of value structure the sorts of relationships that exist between linguistic and cultural groups and how these are represented in education. In my own work (Liddicoat, 2013) I have examined the ways that LPP constructs interculturality a number of contexts and has shown that interculturality becomes a relationship of inequality in policies relating to the education of immigrant and indigenous minorities. In such policy contexts, interculturality is presented as a linguistic and cultural adjustment of the minority to the majority and policies rarely make mention of the need for reciprocal adjustments of majorities to minorities. Interculturality is thus presented to immigrant and indigenous groups as the cost of maintaining their linguistic and cultural diversity and as a requirement for participating in the dominant society. In these contexts, it is the differential valuing of the language and culture of the mainstream that normalizes a monodirectional linguistic and cultural adjustment; those whose languages and cultures represent less cultural capital in the linguistic marketplace need to develop their cultural capital by learning to engage with dominant groups, while learning to engage with non-dominant groups is not represented as adding to the cultural capital of dominant groups.

Promoting multilingualism

LPP in education is not always about limiting or constraining linguistic diversity, it can also seek to expand linguistic repertoires of speakers of a dominant language by adding additional languages. In cases where multilingualism is promoted, language policies construct the types of multilingualism that are valued in the society and in these constructions hierarchies of value shape educational provision. Language education programs typically present a small selection of languages that are made available for students to learn and this selection indicates something about which languages are valued in society and what criteria are used for giving value to languages. In some societies, language policies indicate that language study is required by learners but do not specify which languages will be studied, often delegating the decision about language study to the schools themselves. In such contexts, the choice of languages made is informed by the value that these languages have in the linguistic marketplace. For example, in most European Union countries there is a policy that students will study two languages at school in addition to the official language of their country. One language (Modern Language 1) is usually begun during primary education and the other (Modern Language 2) in secondary education. Most policies do not state which languages will be taught as Modern Language 1 or 2, but invariably the choice is made to teach English as Modern Language 1 and the languages of a limited number of other languages as Modern Language 2. The decision to teach English reflects ideologies of English as the language of international communication, of economic advantage and of cultural prestige (Climent-Ferrando, 2016; Krzyżanowski and Wodak, 2011). The languages taught as Modern Language 2 similarly reflect the values of the linguistic marketplace with the economically, politically and culturally dominant languages of Europe (e.g., French or German) or of elsewhere in the world (e.g., Chinese) being chosen. Other languages are placed in more peripheral positions and many languages are either not widely taught or are taught only in the border areas with countries that speak them. Immigrant languages are not widely taught unless they are also languages of economic or political importance, although they may be made available to immigrants. The policy of requiring two languages is itself an attempt to offset the dominance of English in the linguistic marketplace as one factor that lies behind its introduction is the fear that English poses a threat to the languages and cultures of EU member states. For example, the UE Commission's *Promoting language learning and linguistic diversity: An Action Plan 2004–2006* (Commission of the European Communities, 2003) states “learning one lingua franca alone is not enough” (p. 4) and articulates the potential threat of English to other European languages:

In non-anglophone countries recent trends to provide teaching in English may have unforeseen consequences on the vitality of the national language. University language policies should therefore include explicit actions to promote the national or regional language (p. 8)

While this policy seems to reflect a valuing of more generalized multilingualism, in that it supports learning of a wider range of languages, it remains nonetheless a restrictive policy in that it favors the languages of EU member states and attempts to promote a cultural rather than economic criterion for valuing languages, but one that is understood from within the logic of European integration. Climent-Ferrando (2016), however, argues that the political rhetoric that supports multilingualism and linguistic diversity is not born out in practice and that decision-making remains embedded in the economic rationale of the linguistic marketplace. The ways that various languages are valued in Australia's ALLP discussed above is a further example of the value systems that underlie policies for the teaching and learning of additional languages.

Policies may also favor particular pathways to multilingualism over others. In particular, policies may favor what Skutnabb-Kangas (1981) has called “elite” multilingualism—the acquisitions of additional languages other than the dominant language of the society through schooling—over “folk” multilingualism—the acquisition of a language through primary socialization into a non-dominant language (see also De Costa, 2019). This bias in how multilingualism is valued can be seen for example in an Australian language policy proposal on Asian languages (COAG, 1994), which has a lengthy discussion of the need to develop high level abilities in a number of Asian languages but does not mention the existence of large heritage-language communities of some of the those languages or the possibility of developing educational programs to develop their languages further (Liddicoat, 2013). Thus, the policy is entirely focused on new learning of these languages by non-speakers. Clyne (2008) identifies a similar orientation to elite multilingualism where language curricula are designed entirely for new speakers of the language and heritage language speakers are excluded from programs because they have an “unfair advantage” in the form of previous knowledge of

the language. Scotland's 1 + 2 language education policy would seem to be a counter-example to such thinking in that it aims for every child to have mastered the basics of two languages in addition to their first language by the time they leave primary school and thus implies a strong level of support for multilingualism. However, while the policy seems to support folk multilingualism, in practice there are few opportunities available for speakers of most non-dominant languages to receive educational support for their first languages (Hancock and Hancock, 2018). There thus seems to be a disconnection between policy rhetoric and practice in which valued forms of multilingualism are more likely to receive support that is more than symbolic.

Valuing and validating multilingualism—future directions for policy and research

Language policies, whether overt or covert, macro-level, meso-level or micro-level, involve decisions about how languages will be used and perceived within complex language ecologies. Research in LPP has tended to focus on policies and their impacts on societies, but much of the scholarship until recently has tended to give attention to the languages of focus in policies rather than examining them within an ecological setting to examine how policy interventions shape and are shaped by the language ecologies into which they enter. These language ecologies are permeated by texts, discourses and practices that construct frameworks for understanding languages, their use, and their value in society. One consequence of this is that multilingualism itself is often not highly valued or that many forms of multilingualism are not valued and existing ideological positions remain entrenched. This system of valuing underlies a range of policy contexts from those that are overtly antagonistic to multilingualism to those that are overtly supportive of it. LPP research has begun to investigate language policies as ideological positioning and so is beginning to understand the consequentiality of policies for languages that are included in or excluded from various policy settings and to understand how there can be both planned and unplanned consequences of language-related decision-making. While there has been substantial critique of the consequences of language policies and the ideologies that underlie them, there has been less work that has focused on addressing these consequences and in understanding what a contextualized, ecologically oriented policy response to multilingualism might be. LPP studies have only begun to look at the complexities of language policies and the multiple levels at which they exist in society, there is a distinct need for more studies that examine how policies play out across levels and how the texts, discourses and/or practices that exist at one level interact with, shape and transform those that exist at other levels.

Globalization has led to widely felt tensions in language education these days. Globalization has widened the gap between the haves and the have-nots, a situation which causes people to raise questions about the unbridled reign of free trade, immigration, and blurred national borders. As a result, European and North American countries saw the rise of populist and isolationist nationalism over the last decade, a movement in which supporters argued for the strengthening of borders and anti-immigration policies. Now spreading into other parts of the world, this movement has led to racial tensions and occasionally racial cleansing, like what has happened to the Rohingya people in Myanmar in recent years. Nationalism, being increasingly asserted in many countries, comes to perpetuate language and cultural boundaries—boundaries that go directly against fluid language practice and flexible identity formation on the ground (You, 2010, 2018). The assertion of national identity in many countries requires that we reconsider how to define and teach literacy in an age of globalization.

In this chapter, we would like to extend the scholarship on globalization and literacy education by highlighting work done at the intersection of literacy, culture, and disposition under such terms as “translanguaging,” “translingualism,” and “transliteracy.” We will first review literacy-related concepts developed in response to globalization and then consider the notion of “transliteracy” in the context of language education. We will then review published studies that have drawn on transliteracy as well as translanguaging and generalize practical guidelines for teacher education and classroom instruction. While transliteracy has gained solid ground in literacy education, it has also received criticisms. Next, we will introduce these criticisms and how they can refocus the application of transliteracy in education. Finally, we will discuss future directions for the exploration of transliteracy, including historical applications, applications outside the classroom, and intersections with other fields, such as new materialism, comparative/cultural rhetoric, disability studies, and technology.

Definition of transliteracy

Over the last three decades, scholars have proposed different conceptualizations of literacy amid the rise of new media and globalization. For example, the pedagogy of multiliteracies advocated by the [New London Group \(1996\)](#) has deeply influenced literacy and language teaching in the West. The group argues that traditional literacy pedagogy is inadequate in the post-Fordism era in which communication channels and media have multiplied and cultural and linguistic diversity has increased. A pedagogy of multiliteracies assumes that “language and other modes of meaning are dynamic representational resources, constantly being remade by their users as they work to achieve their various cultural purposes” (Cope and Kalantzis, 1999, p. 5). Working in the fields of new media, arts, and creative writing, [Thomas et al. \(2007\)](#) proposed the term “transliteracy” as both a practice and a heuristic to understand what being literate means in the new media age. They define transliteracy as “the ability to read, write and interact across a range of platforms, tools and media from signing and orality through handwriting, print, TV, radio and films, to digital social networks” (Section “What is transliteracy?”, para 1). By emphasizing the interaction among text, visual, and digital literacies, the concept decenters text-based writing and reading. What the concepts of “multiliteracies” and “transliteracy” share is that globalization and the rise of new media have brought to light the fact that we communicate by interacting with multiple modes and media on a daily basis, not only now but also in the past.

These new concepts of literacy have inspired numerous explorations that intend to capitalize on the affordances of new media for literacy education. For example, [Gogan and Marcus \(2013\)](#) incorporated transliteracy into their school’s public library summer reading program. When reading a book, students used a tool called “VoiceThread” to take part in conversations, formulate ideas, and share higher-order thinking through a variety of media channels such as video, audio, text, images, and music. They also communicated with the book’s author through blogs and websites. Similarly, [Aillerie \(2019\)](#) described an experiment conducted at a French high school to observe and test students’ transliterate skills. Placed in small groups, students were required to use all kinds of media and tools to collect data for their projects. The focus of this experiment was on “the possible diversity of media

and tools employed, on the ways of and reasons for switching from one to another, on how these different media and tools are distributed within contexts, according to the academic requirements and tasks individually and collectively performed by the students" (p. 740).

While inspiring pedagogical explorations on the affordances of new media, these new concepts of literacy also have encouraged scholars and educators to examine the connections between languages using terms such as "translanguaging" and "translingualism." In applied linguistics and language education, scholars have emphasized both the fluid and artificial boundaries among languages and across modes of representation in human communication (Blackledge and Creese, 2010; Canagarajah, 2013a; García, 2009; Jordan, 2015). This added emphasis helps to define what it means to be literate not only in an age of new media but also during an era of rapid globalization and the limits of past conceptions of literacy on both. They suggest that our sense of language and dialect has been deeply influenced by nationalism, which has taught us rigid rules and forms within lingua-cultural boundaries. In practice, languages are neither discrete nor stable but rather dynamic and negotiated, and writing necessarily involves the negotiation of language differences. While this was always true, globalization makes it harder to ignore. In studies of spoken and written interactions, Canagarajah (2013a,b) used the term "translingual practice" to break down the boundaries of linguistic codes in a speaker's communicative repertoire. He emphasizes two key points in human communication: first, communication transcends individual languages because languages are always in contact and mutually influencing each other; and second, communication transcends words and involves diverse semiotic resources and ecological affordances. It is this second point that reinforces the move from multiliteracies to transliteracy that Thomas et al. (2007) made and that characterizes this chapter's emphasis on transliteracy, rather than "translingual practice" alone.

Transliteracy, then, provides a pedagogical framework that maintains an emphasis on educating students in not only multiple languages and dialects but also multiple modes and new media. Furthermore, in the field of English education, You (2016) has argued for a cosmopolitan orientation to transliteracy. This orientation emphasizes that, though sometimes defined by kindred relations, ethnicity, nation, race, or class, all people are first and foremost members of the human race and as such are always in relation with those outside their own identifications; further, they have the agency to develop and sustain new allegiances across cultures, communities, and languages. Embracing such an orientation, You (2016) suggests that the demand for cultivating global citizens requires that educators seek to cultivate in English users the ability to engage with diverse cultural discourses through reading and writing using Standard English, other Englishes, other languages, and other semiotic resources. This ability necessarily requires that English users negotiate across language differences and consciously and effectively shuttle between communities they belong to or will belong to. He calls this ability and its enactment transliteracy. Ultimately, transliteracy should foster in English users a transcultural disposition, "involving an intellectual and esthetic stance of 'openness' toward peoples, places, and experiences from different cultures, especially those from different nations" (Szczesny and Urry, 2002, p. 469). While institutionally students remain citizens of a certain nation, morally and culturally they become citizens of the world. In other words, transliteracy is a translingual and transcultural practice with a cosmopolitan imperative.

Transliteracy teacher toolkit

Putting transliteracy to use in the classroom can be implemented in two ways: (1) as a cosmopolitan disposition that encourages translingual, transcultural practice or (2) as translingual, transcultural practices that encourage a cosmopolitan disposition. For teachers and teacher educators, transliteracy as practice is both an approach and a practical toolkit; and for those looking for a way into applying transliteracy to the classroom, it is important to first acknowledge the relationship between literacy and habitus within education.

As a cosmopolitan disposition, transliteracy reorients the way in which we approach language. This allows transliteracy to be adaptable yet necessarily asks language users to recognize how it is that language shapes us as we learn (Lee and Jenks, 2016). Scholars have already uncovered the transformation of US literacy education from moral to economic imperative (Graff, 1979; Brandt, 2004). This work reveals the extent to which literacy has been asked to shape students into particular ways of thinking and acting that are ideological. Bourdieu (1979) neatly defines this dynamic through concepts like habitus and cultural capital. The typical habitus encouraged by schooling, he explains, is a social conditioning into the implicit rules of decorum that students come to internalize, maintaining the status-quo. Cultural capital is moderated by schooling whereby institutionalized norms, such as standardized literacy, both determine and become valuable for class mobility. Understanding the social and cultural role of schooling in this way, a cosmopolitan disposition encourages students and teachers to understand the connection between literacy and habitus and asks them to instead work to shape literacy in ways that allow for and forward a new status-quo built on cosmopolitan principles of inclusion, linguistic diversity, and social (r)evolution, rather than class mobility, monolingualism, and social conformity. This disposition, then, seeks to foster a position of openness toward difference (Horner et al., 2011a). It understands difference as generative and sees the encounter with the "other" as imperative to self-understanding that emerges out of exchange, rather than alongside, against, or in spite of another. This cosmopolitan disposition lays the groundwork for the translingual and transcultural negotiation that motivates transliteracy practice.

As a pedagogical approach, transliteracy can provide us with concrete ways in which to foreground language as a negotiated process. Broadly speaking, these translate into the following translingual moves: advocating for writer agency, encouraging the use of other languages, assuming heterogeneity as the classroom norm, and challenging English monolingualism; yet, at the same time, best practices in translingualism are continually evolving (Sun and Lan, 2020). As an example of this, Canagarajah (2013c)

identified negotiation strategies that can help frame transliteracy in text production. Based on ethnographic classroom research, these strategies are broken down into the following rhetorical moves shared between writer and audience: envoicing, recontextualization, interaction, and entextualization. Each demonstrates the many possibilities for putting transliteracy into practice, but together show how malleable transliteracy can be. For example, envoicing highlights the personal construction of authorial voice and the ways in which writers choose to mark their identity in writing. Envoicing understands language as performative and rhetorical, not just a medium for meaning but an outlet for playing with and changing how language makes meaning. To practice envoicing means taking the agency of the writer seriously—regardless of that writer’s education and position, and in spite of the power readers may hold over those writers, especially as teachers. Teachers work to respond to student writers as curious readers rather than as graders or institutional gatekeepers. Another negotiation strategy, interaction, further draws attention to the dialectic between reader and writer that shapes texts. Interaction as a strategy acknowledges that writing is a process of alignment where writers can invite readers into the meaning-making process and open the text up to different, imaginative interpretations. The strategy of recontextualization highlights the process by which this happens. Recontextualization incorporates feedback and drafting into the making of meaning, centering the social negotiation of voice, interaction, and textual production over time. Entextualization, then, a final strategy, accounts for the spatiotemporal dimension of the texts themselves, how it is that the long process of social negotiation becomes part of the text, embedded to facilitate that connection between reader and writer and the alignment of authorial voice with creative audience interpretation. Translingual practice broken down into these four negotiation strategies highlight that as a practice, translingualism always aims to facilitate the co-construction of meaning. Transliteracy emphasizes that such co-construction happens across different languages, modes, and cultures. It is invitational and generative, working to disperse creativity while empowering readers and writers to explore agency in conversation *with*, rather than in spite of, the other.

Transliteracy can then be practiced on the level of disposition. In designing courses that prepare teachers to use transliteracy in their classrooms, this means acknowledging—and actively overturning—the relationship between literacy and power. Teacher-trainers can empower new teachers to critically understand this complex dynamic and encourage on-going reflection so that teachers evaluate their own internalized grammars. One way to do so is by engaging in negotiation strategies that rewrite the relationship between language users; in particular, their relationship with their students. By contextualizing language as a negotiated, co-constructed process that evolves across time and travels through different spaces, teachers not only can begin to help students develop concrete transliteracy strategies like envoicing, interaction, entextualization and recontextualization that foreground negotiation but also prepare themselves for the kind of collaboration that fuels language (r)evolution.

Transliteracy as a translingual, transcultural, and cosmopolitan practice

While transliteracy began as a way to theorize meaning-making in an era of rapid globalization, as scholars have continued to research its implications for literacy education, they have underscored its value for transforming research and classroom practice. Transliteracy is both a translingual and transcultural practice. In bringing the two together, it links practice with disposition, encouraging flexibility and careful consideration to intents and purposes. Transliteracy, then, is useful not just as a theoretical framework but also as an adaptable tool for teaching and research.

In the classroom, transliteracy involves both teachers and students in actively reframing the goals of literacy education. Rather than teaching literacy as an autonomous product, literacy is taught as a negotiated process. This calls for teachers to prepare students to reflect on their language practices, decision-making processes, and changing contexts and communities. Instead of focusing on assimilating students to standardized literacy expectations, teachers support metacognition by teaching students to recognize these expectations and negotiate the ways in which they can choose to voice difference or sameness. This means discussing code-switching (Canagarajah, 2013a) or unexpected linguistic choices such as the use of the phrase “can be able to” (Lu, 1994); more broadly, teachers can foreground rhetorical decision-making in the classroom, analyzing an author’s use of multimedia and choice of medium, genre, or delivery (Bawarshi, 2016; Guerra, 2016; Lorimer-Leonard, 2014; Schreiber, 2019; Shipka, 2016). Teaching transliteracy engages students in establishing voice in their writing, allowing students to work on skills of linguistic negotiation (Alvarez et al., 2017).

From assessment to assignment and course design, transliteracy as practice redirects the typical flow of power in the classroom. First, practicing transliteracy asks teachers to critically evaluate their assessment practices. Instead of grading students on the final product alone, teachers may consider grading students based on revision and reflection (Canagarajah, 2016); or, they might consider replacing conventional writing tests with labor-based contracts (Inoue, 2017). Beyond assessment, there are multiple ways to reimagine assignments to foster transliteracy, such as restructuring peer review in Jordan’s (2012) scaffolded peer interaction, and teaching genres like the critical literacy narrative, as discussed by Young (2004); both decenter the instructor and invite students to center their own literacy practices. And finally, teachers and administrators might consider using transliteracy to redesign their writing courses by, for instance, integrating second language writers into mainstream sections, inviting new models of ownership, and incorporating cross-cultural global or community partnerships (Alvarez and Alvarez, in press; Lee and Alvarez, 2020; Lee and Jenks, 2016; Wu, 2018; You, 2016). While such practices can support multilinguals and other students whose home literacy practices are excluded from the academy, teaching transliteracy emboldens all students—including those who identify as monolingual—to ask and then assert how it is that they want to communicate with the dominant discourse (Lu and Horner, 2013).

Transliteracy as classroom practice recognizes the push and pull of academic discourse and challenges its structured dominance by involving readers and writers in its deliberate restructuring.

Transliteracy as a research practice similarly challenges the structured conditions in which literacy scholars pursue and disseminate their research. Transliteracy as a tool for research seeks to foster critical metalinguistic awareness that unsettles the ways in which scholars have internalized the nationalistic and colonial tendencies of literacy research. This first means addressing the geo-history of the native speaker and the implications of English monolingualism in the past and present (Trimbur, 2008; Horner and Trimbur, 2002). As Horner et al. (2011b) argue, “English monolingualism is manifested not simply in the language(s) of the scholarship produced but the language(s) of scholarship cited, the bibliographic resources on which composition scholars rely, the forums in which the scholarship circulates, and the arguments it makes” (p. 272). Transliteracy as a research method, then, first questions the tacit policy of English monolingualism that has structured schooling and confronts the tension monolingualism generates with the reality of a diverse, multilingual world. Transliteracy changes the time and space in the doing of research by understanding the field of literacy studies as “an on-going historical project” (Horner, 2016, p. 8).

Because these forms of dominance shape practice and power into the present day—from the exclusion of non-English texts in journals to understudied non-English writing cultures—engaging both local and global differences in researching literacy can help to confront the unexamined assumptions that allow monolingualism to persist. That is, one way to not only acknowledge but to resist the dominance of monolingualism is to expose ourselves to different ways of constructing and sharing knowledge across time and space. As a research method, transliteracy encourages scholars to work across languages, across disciplines, and across media. It is research with a cosmopolitan imperative that builds on both translingual and transcultural practices. This method can be as simple as reading research outside the field and as complex as committing to learning, using, and researching in other languages (Zaleski, 2018a, 2020). In both cases, researching this way asks scholars to learn from and engage with outside work that goes beyond mere “linguistic tourism” (Matsuda, 2014), taking care to not decontextualize or elide external contributions and paying attention to the labor of translation (Horner and Tetreault, 2016). Transliteracy as research practice has the ability to transform our research context and our respective fields by crossing borders, but such border-crossing requires a cosmopolitan orientation to research and cosmopolitan practices like decentering Western epistemologies and recentering historically marginalized ones (“epistemic de-linking”) and situating knowledge-making in in-between spaces (“border thinking”) (Mignolo, 2007). It calls for an awareness and sensitivity to location and context (Alvarez, 2018; Lee and Alvarez, 2020). Transliteracy as research practice asks scholars to commit to decolonial methods that interrogate interpersonal, institutional, and historical arrangements of power that structure research and our relationships with subjects and audiences, calling us to ultimately interrogate our own positionality (Cushman, 2016). And, it is important to note that such a shift facilitates new ways of training and mentoring scholars (Kilfoil, 2015; Zaleski and You, 2022).

Transliteracy as a practice changes how we teach and research. It engages academics in the conscious making of literacy by drawing attention to the way in which we choose to make meaning. In other words, transliteracy foregrounds language as choice, a choice to reproduce more of the same or to remake literacy through its diversity. In changing literacy praxis, scholars develop new transcultural attitudes and cosmopolitan dispositions that acknowledge the labor of translation and decentralize power by recontextualizing our place in the world. Therefore, transliteracy as practice depends on a dialectic between literacy praxis and cosmopolitan dispositions.

The ethics of transliteracy

The transliteracy perspective has received criticisms from applied linguists and literacy scholars. For instance, applied linguist Kubota (2016) has criticized the proponents of the perspective for having unwittingly aligned themselves with neoliberal multiculturalism “that celebrates individual cosmopolitanism and plurilingualism for socioeconomic mobility” (p. 475). She is concerned that the perspective has not seriously considered how racial and other power relations might affect the ways people use, learn, and teach language. She is worried that the perspective does not improve the life of those who are linguistically, racially, and economically marginalized in globalization. Responding to the neoliberalism charge, Canagarajah (2015) suggested that while neoliberals use translingualism as a product and as a commodified branding mechanism, proponents of the translingual perspective view it as a practice that is politically savvy and socially conscious, and sensitive to power, social norms, and audience. In this respect, teaching transliteracy means not just teaching transgressive language practices but also pursuing a social justice agenda that resists the neocolonial and nationalistic tendencies of literacy education and instead forwards a critical, cosmopolitan ethics.

To resist neoliberal and neocolonial tendencies, scholars of color have underscored the importance of centering the struggles and literacy practices of the underprivileged in research and pedagogy. For instance, Gilyard (2016) was concerned that proponents of translingualism have flattened language differences, blurring the boundaries between differences in communication in general and those encountered in the education of African American students in particular. This tendency ends up erasing the Black community’s struggles for survival, perpetuating language as abstraction and alienating scholars of color. Therefore, Gilyard suggests that proponents of translingualism could study students’ efforts, struggles, and triumphs in transforming education systems and fighting for social justice through translanguaging. Gilyard was recently joined by other Black scholars who seek to expose and redress racism in language education and research. These scholars demand Black linguistic justice, asking teachers to stop using academic language and standard English as the accepted communicative norm and to instead teach Black students about anti-Black linguistic racism and white linguistic supremacy (CCCC, 2020).

Meanwhile, transliteracy was also censured by those who held a monolingual and pragmatic perspective to language education. These individuals charged that proponents of the translingual perspective had ignored students' desires for Standard English and downplayed the importance of linguistic norms (Atkinson and Tardy, 2018). Responding to these charges, You (2020) argued for a yin-yang dynamic between national/monolingual and transnational/translingual perspectives to language and literacy pedagogy. Students' desires and expectations are informed by both national and transnational forces, and transliteracy has focused on those informed by transnational forces. Linguistic norms and variations are in a dialectical relation, he suggests, and not easily separable in practice. When we use language, we begin with norms developed in a certain community and use them creatively or transgressively in our interaction with context and audience, hence creating variations.

Although some scholars are critical of transliteracy, others hold hope for its potential power for leveling hierarchies of thoughts and languages fostered by modernity's colonial matrix of power and for generating pluriversal understandings, values, and practices. For example, Cushman (2016) suggests translingualism be defined as meaning making processes that involve students and scholars in translanguaging, translating (trans-actions), and dwelling in borders. She argues that translingual approaches must work at the paradigmatic level to reveal and potentially transform colonial matrices of power and at the pedagogical level to allow students to express their languages and categories of understanding. These epistemological and pedagogical moves might together lead to epistemic delinking and border thinking, or transcultural dispositions, crucial for decolonization of thought and language.

These criticisms of transliteracy or translingualism and their ensuing conversations suggest that while focusing on cultivating responsible global citizens, we need to continue pursuing social justice in teaching and studying transliteracy. As scholars have suggested, while notions such as hybridity, fluidity, and multiplicity highlighted by the translingual perspective are potentially liberating, they can obscure the struggles and inequalities brought about by globalization. We need to stay alert to the way in which neoliberalism has widened economic and educational gaps and encouraged a kind of multiculturalism that evades racism and other social injustices. Thus, in teaching and studying transliteracy, as Kubota (2016) has warned, "more explicit attention should be paid to issues of asymmetrical relations of power and inequalities that privilege or stigmatize individuals and groups due to their plurilingualism, cosmopolitanism, and hybridity on the one hand, or their monolingualism and monoculturalism on the other" (p. 490).

Future directions

Thus far, transliteracy has inspired numerous studies on students' literacy practice as well as pedagogical applications (for pedagogical applications see Canagarajah, 2013c; De Costa et al., 2017; Frost et al., 2020; Horner and Tetreault, 2017; Lee and Jenks, 2016; You, 2016). Looking forward, we already see rising on the horizon its applications in historical studies, applications outside of the classroom, and its intersections with other fields, such as new materialism, comparative/cultural rhetorics, disability studies, and technology. In this final section, we will give an overview of these new applications with the intention to identify areas where transliteracy is well poised to make a contribution.

Transliteracy highlights the fact that humans communicate by interacting with multiple modes and media, not only in the present but also in the past. This insight has inspired historical explorations of language and language education, explorations that have elucidated how individuals, groups, and institutions exercised agency and political power through translingual practice (Arnold, 2014, 2018; Kimball, 2021; You, 2023; Zaleski, 2018b). For instance, using a material translingual ecologies perspective, Zaleski (2018b) studied Jesuit rhetoric as it traveled between Europe and India by looking at how the Jesuit educational work was enmeshed in both new and old social relationships and constructed through rhetorical practices that were textual, material, and embodied. Kimball (2021) examined discourses of language, religion, and education in early Philadelphia from a translingual perspective. The city was essentially a translingual space, where communities such as Germans, Quakers, and African Americans developed metalinguistic conceptions of what language was and how it mattered in their relations and the nation formation.

As early as 2013 (Canagarajah, 2013a), research on literacy began connecting language practice in the classroom to extra-curricular ecologies and environments, situating literacy in the marketplace and across the world. Scholars have attempted to better understand the direct relationship between the classroom and the world (Nordquist, 2017), and more recently to build on "the mobility turn" in composition studies to trace the ways in which texts create meaning as they travel (Faist, 2013). Incorporating work in sociolinguistics from Blommaert (2013) and Kell (2015), literacy scholars like Viera (2019) and Lorimer-Leonard (2017) are charting exactly how literacy travels; that is, how transliteracy is negotiated across both space and time.

This work has been influenced not only by the mobility turn but also new materialism and studies of digital networking, including research from rhetoric and composition scholars like Prior (2010), Spinuzzi (2015), and Jordan (2015). Such work further defines the way in which transliteracy foregrounds diverse semiotic resources as meaning-making tools and helps us to understand exactly the ways in which transliteracy engages complex ecologies to restructure meaning. At the same time, such work questions fixed understandings of human agency. Scholars such as Ruiz and Arellano (2019) have complicated these understandings of agency and power by bringing together transliteracy, new materialism, and decolonial methods. Similarly Zaleski (2020) and Zaleski and You (2022) have brought together transliteracy and research on comparative/cultural rhetorics to decenter and resituate literacy practice elsewhere. These studies have benefited from comparative rhetoric's emphasis on rhetoric as culturally

constructed and its commitment to interrogating research positionality in the study of other cultures. Scholars have also interrogated assumptions about language and voice by reflecting on their own identity as multilingual scholars of writing. Scholars like Lee and Canagarajah (2019) and Canagarajah and Matsumoto (2017) have used their position as teachers, students, and mentors, as well as their relationship to each other, to underscore the complex voices engaged by transliteracy and how transliteracy requires a commitment to on-going identity work and relationship-building.

As transliteracy highlights human communication taking place through multiple modes and media, technological affordances are a natural area to extend literacy scholarship. Scholars have examined students' transliteracy practices and identity construction in social media (DePew, 2011; Lee, 2011; Liu, 2018; Schreiber, 2015; You, 2008, 2011) and developed pedagogical activities to engage students in exploring multilingual and multimodal resources for promoting accessibility, social justice, and cosmopolitanism (Fraiberg et al., 2017; Gonzales and Butler, 2020; Wu, 2018; Wu and Li, 2019). For instance, focusing on identity construction, Schreiber (2015) examined a Serbian college student's literacy practice on Facebook. She found that as a hip-hop artist, this student constructed a fluid transnational identity by capitalizing on the affordances of multimodality; he used Serbian or English and posted images and links to video clips to mark his membership in local and global hip-hop communities. Drawing on disability studies, Gonzales and Butler (2020) designed multimodal assignments in which students were asked to examine the issue of accessibility through multilingual/multimodal community engagement, reflecting on communication differences, and analyzing communication in practice. Literacy educators have increasingly used new communication tools for intercultural communication activities that cultivate cosmopolitan disposition. Wu (2018) reviewed some of these efforts over the last two decades and concluded that these activities are inherently transnational because when participants are engaged in virtual communication, their identities projected, relations forged, and languages practiced all emerge from the context, defying any static or discrete nation-based grouping.

These emerging trends in transliteracy scholarship underscore the importance of pursuing transliteracy alongside social justice, keeping in mind power and privilege as researchers incorporate new ways of studying literacy practice. At the same time, such scholarship demonstrates transliteracy's contribution to developing a more critical habitus toward language-making. It reveals the ways in which transliteracy's emphasis on language as negotiation, on meaning-making through diverse semiotic resources, and on negotiation as imperative to the evolution of language across time and space have all pushed literacy studies to reconsider its former assumptions about language, and therein, what scholars should research as well as what teachers can teach. By stretching the very basic definition of literacy in this way, transliteracy has posed a question in need of answering to all scholars and teachers: how can we language toward a more dynamic and diverse future? By redefining language and literacy, in particular, the stability provided by definitions, transliteracy has pushed research forward, challenging all researchers to question their assumptions about language and pursue their own ways of transforming literacy education so that it is not only more adaptable, equitable, and just but also a more realistic reflection of the way that languages happen and necessarily evolve.

Society is permeated with ideological notions about language and power that refer to how language should be used, and the “appropriateness” of language in given contexts, and the validation of “standardized languages” that reconstitute misconceptions about multiliteracies and multilingualism. Given that the majority of youth enrolled in public schools in the United States are from historically marginalized populations (NCES, 2022), now more than ever, educational institutions have the opportunity to disrupt historical discourses that have privileged dominant narratives of monolingualism and further build upon the linguistic strengths of multilingual youth. Such justice-oriented work that includes dismantling oppressive systems that fuels misconceptions about multilingualism in education necessitates a critical lens. A critical approach to multilingualism serves as a means for the denunciation of US societal norms that regard multilingualism as a problem and not a right or “a fact of life” for multilinguals (Wei, 2008, p. 3).

Researching multilingualism from a critical perspective locates an individual’s language practices within the social, cultural, and political contexts in which social practices are employed (Blackledge and Creese, 2010; Heller, 2007). In our research we adopt a critical perspective in viewing language as a dynamic practice, as opposed to being heavily regulated by the ideological boundedness of language systems. Such a perspective provides space for disrupting deficit language ideologies (Flores and Rosa, 2015) about multilingual practices, and radical hope for the futures of multilingual children. Hooks (2003) asserts that educators who are committed to rejecting oppressive systems and making classroom a place of mutual liberation for teachers and students, must be grounded in radical hope and freedom. Following hooks’ call for a pedagogy of hope, this chapter will share a summary of our recent research that has challenged misconceptions about multiliteracies and multilingualism situated in various social contexts.

Casting our radical vision: a positionality statement

Our positionalities as a coalition of multilingual scholars who identify as scholars of Color (first, second, and third author) or co-conspirators (fourth author), have fundamentally shaped the main premise of our critical perspectives on multiliteracies and multilingualism. Having all participated in these misconceptions at various points in our personal journeys where we unlearned harmful rhetoric about our own multilingualism, we consider our scholarship, teaching, and service as an opportunity to encourage radical hope in the education of multilingual children. Luz, a multilingual associate professor and Latina scholar with Colombian roots, often challenges students’ deficit perspectives about the Global South. Jim, a current secondary educator and multilingual white

scholar, resists his own presumptions about the hegemony of English that he often utilizes to challenge student discourse about the “legitimacy of academic English”. Vivian, an assistant professor and Chicana scholar, views her scholarship of rejecting students’ negative perceptions of multiliteracies as a reflection of her childhood experiences. She also had teachers whose misconceptions affected her own perspectives of multilingualism; therefore, she considers it of great importance to disrupt similar dominant narratives among her students, pre-service teachers. Brittany, an assistant professor and Black woman scholar, considers her research as an opportunity to interrupt societal discourse that often casts a negative shadow on Black language. Together, our goal is to share how we can rethink multiliteracies and move toward a radical vision for multilingualism grounded in radical hope (Lear, 2006), that disrupts misconceptions in the education of multilingual children. We are determined to radically reimagine a humanizing future for multilingual children by sharing a collection of experiences entrenched in our personal and professional lives.

Misconceptions and radical hopes in the literacy education of indigenous multilingual children

The education of multilingual indigenous children is fraught with misconceptions as it is almost always organized by others (e.g., adults, non-indigenous, monolingual speakers of socially dominant languages). In the case of Latin America, these misconceptions include essentialist notion that Indigenous children are uneducable or incapable of educational success; monolingual ideologies that would require children to abandon their home language(s) in order to “gain” Spanish, English or Portuguese; and neoliberal education policies that work to erase indigenous identities and practices as antithetical to participation in globalized forms of capital.

Because these misconceptions are also grounded in particular geographies, they reflect place-specific understandings and ways of organizing and practicing education. The examples I (Murillo) present, from indigenous schools in Guatemala and Colombia, are located in the geopolitical region of Latin America, as well as within two distinct nation states, each with its own traditions of mis-educating indigenous peoples. Studies of the language and literacy education of Indigenous children who are also (im)migrants reveal the dominant interests that structure schools in the US, Canada, and other “host” nations. And sometimes, as in the application of educational research from dominant neoliberal traditions to curriculum, instruction and materials in Latin American schools (Walsh, 2017), indigenous children are subject to both “national” and “international” deficit perspectives simultaneously.

The idea of Latin America

Eduardo Galeano wrote that “the ultimate goal of the Latin American colonial economy from its inception ... was to serve the development of capitalism somewhere else” (Galeano, 1997, p. 45). The development of capitalism in Europe and the industrialized West was accomplished through the displacement of indigenous populations, appropriation of their land and labor, and a 5-centuries-long project of replacement of Indigenous cultural practices and languages with Spanish and other colonial languages. Language homogenization and the imposition of alphabetic literacy were central to the colonial project of civilizing indigenous “barbarians”, and these forces have continued largely through the institution of schooling. In response, indigenous resistance movements have emerged to enact “concrete processes, struggles, and practices of resurgent and insurgent action and thought, including in the spheres of knowledge, territory-land, state, and life itself” (Mignolo and Walsh, 2018, p. 9).

Radical hope

To illuminate examples from my research in Guatemala and Colombia, I use Jonathan Lear’s theory of radical hope. Lear (2006, p. 104) writes that what makes hope radical

is that it is directed toward a future goodness that transcends the current ability to understand what it is. Radical hope anticipates a good for which those who have the hope as yet lack the appropriate concepts with which to understand it. What would it be for such hope to be justified.

Thus, researching and teaching with radical hope means envisioning and working toward a more just society, one that we have yet to experience. Lear suggests that radical hope is “intimately bound to the question of how to live” (p. 105) in times and situations that seem otherwise hopeless. Given the abject history of schooling for indigenous children around the world, radical hope seems an apt metaphor for those who wish to imagine the outlines of a better future for speakers of indigenous languages.

What US teachers learned about indigenous children and their schools in Guatemala

State-sponsored violence against Indigenous population has expelled many Guatemalans. One migration stream, from Q’anjob’al communities in the northwestern province of Huehuetenango, has settled in agricultural communities in central Illinois, where they are looked down upon by white and African American speakers of English, as well as by Mexican immigrants who identify as white or mestizo. Fieldwork in the local schools and early childhood centers, along with my university courses with in-service literacy teachers, revealed that teachers felt unprepared to teach these newcomer students. I (Murillo) found common misconceptions about

indigenous languages. Many teachers, including ESL and bilingual teachers, expressed the view that the Guatemalan children spoke Spanish “badly” or “incorrectly”, and quite a few believed that Q’anjob’al is an inferior dialect of Spanish. Although they had little direct experience with or training about Latin America, teachers questioned the value of the education children had experienced before coming to the US. Several teachers wondered if there were even schools in Guatemala.

To inform the work of Illinois teachers, I (Murillo) visited families and schools in sending communities in Huehuetenango. My goal was to document the educational experiences of indigenous children. I wanted to provide information about Q’anjob’al speakers’ bilingualism and mestizo identity and the safety, economic, and political motivations behind their decisions to migrate. Above all, I sought to humanize the idea of Q’anjob’al migrant children and families. To give teachers a sense of what schools and classrooms in Sta. Eulalia looked and sounded like, I took photographs and interviewed children, teachers, and school administrators, and observed lessons in elementary and secondary classrooms. I also collected examples of lesson plans, bilingual textbooks, and teacher-made materials. I hoped to use this knowledge to challenge misconceptions teachers might hold about indigenous people, about education in Guatemala and, by extension, the educability of indigenous children.

In Illinois, I shared my findings through teacher workshops and in my university literacy courses. I was struck by the positive reactions to images and descriptions of Guatemalan classrooms, sparsely furnished but beautifully decorated with teacher-made posters and examples of student work in Q’anjob’al and Spanish. Teachers were surprised to learn that the curriculum included textbooks in two languages and commented on the esthetic differences between the Guatemalan materials and the worksheets that dominated the instruction of immigrant children in Illinois. Another surprise was that elementary school teachers in Guatemala must study a pre-university year and then three years full-time university study to earn certification. This is, as several teachers observed after reading excerpts from interviews with bilingual educators in Huehuetenango, more preparation in the field of education than many Illinois teachers receive. We addressed misconceptions about Q’anjob’al and bilingualism in Indigenous languages by inviting a university linguist who specializes in Guatemalan languages. In these ways, I sought to help Illinois educators recognize the multilingualism of their Q’anjob’al families and the value of immigrant children’s and parents’ previous schooling.

Developing autonomy in an indigenous bilingual school in Colombia

A second example comes from my (Murillo) research with an Arhuaco community in the Sierra Nevada mountains of northern coastal Colombia. The Arhuacos are known as one of Colombia’s most resilient Indigenous groups, based on their defense of territory, language, and cultural practices. Ethnolinguistic maintenance among the Arhuaco is rooted in strong feelings of pride in being Indian and in speaking Ika, their ancestral language. Since the early 1970s the Arhuacos have sustained a strong movement that grounds their rights to *educación propia* (our own education) in a broad defense of their lands and culture. After boycotting and eventually shutting down government schools in 1982 (Murillo, 2009), the Arhuaco school in the community of Simurwa re-opened their school with an indigenous, bilingual faculty and an “indigenized” curriculum that sought to balance local knowledge and the Colombian national curriculum. In 2001, dissatisfied with the continued encroachment of non-Indigenous values among their youth, the Arhuacos closed the school to rethink their curriculum. My work at the Simunurwa school consisted of documenting Arhuaco efforts to decolonize schooling and to answer with them the question that had led to the school closures: What should be done with an institution that has been harmful to the community’s linguistic sovereignty and identity but which holds forms of knowledge, including print literacy, mathematics, and the Spanish language, that the Arhuaco regard as necessary for protecting their lands, identity, economic and political viability, and even physical security? (Murillo, 2009, 2021). In 2002, the community formally established the autonomy of the school under control of the Arhuaco People and reopened the school with a restructured curriculum emphasizing Ika/Spanish biliteracy and locally relevant curricula.

Research with Indigenous multilingual communities and schools in Latin America suggests ways that education and educational research can be restructured to protect Indigenous communities and their languages. The defense of territory, language, and education in indigenous communities in Guatemala, Colombia, and elsewhere in Latin America has often been accompanied by linguists, anthropologists, and literacy experts. As noted by Fals-Borda, this project involves working within and “against a university colonized by Western Euro American culture and so subordinating that it impeded useful discovery of our own realities” (2009, p. 360). Multilingualism researchers must embrace new research paradigms and move away from a tradition of studying about indigenous education to new forms of research that frame indigenous education within broader struggles for territorial and educational autonomy. Adopting new research methodologies and approaches like those I have described is one way that researchers can practice radical hope.

Language Partners: disrupting deficit discourses about multilingual futures

Historically, language and literacy education has carried the weight of a great equalizer, believed to provide access to economic and social opportunities for individuals who could develop the correct practices. Globally, literacy education has been viewed as a means of reducing poverty and national “development” (Hernandez-Zamora, 2010; Spolsky, 2010). Similarly, within the US, language and literacy education has been associated with moral development, national unity, economic sustainability, and national security (Brandt, 2004). While these claims are exciting, it is important to question whether building additional language and literacy practices operates equally for all, holding the same potential benefits for all individuals.

Drawing on data from an 18-month qualitative study which focused on how language ideologies shaped classroom practices and policies in Language Partners (LP), a prison-based, peer-taught, adult language and literacy program situated in the US Midwest, I (Sosnowski) examine how discourses pertaining to the promises associated with multilingualism and multiliteracies shaped the choices and actions of the LP students and their perceptions of their future possibilities. After introducing LP, I compare how similar forces operated to influence LP students' choice to immigrate to the US and how similar discourses are again operating as these men are deported after their incarceration.

Origins of Language Partners

LP began when an incarcerated individual, who was part of a higher education in prison program, proposed that he and his peers create an English language and literacy course for fellow incarcerated men who could not speak English. He observed that individuals who could not operate in English struggled to navigate the linguistic landscape of the prison, beyond what others normally experienced. With the support of volunteers, like me, from a nearby research-focused university, they developed a program that met every Tuesday and Thursday for 3 h class sessions. As a peer taught program, a team of incarcerated individuals planned and taught each lesson. A grammar-focused textbook guided the curriculum with each class focusing on a discrete grammatical feature. Since LP began offering classes in 2010, nearly all students enrolled in LP were immigrants from Mexico, Guatemala, and Honduras and identified Spanish as their dominant language.

Push and pull of neoliberal forces

Many LP students shared similar motivations which shaped their choice to immigrate to the US. These motivations were captured in an essay written by an LP student, Felipe, in which he recounted his immigration story. He began his story by stating, "I never thought I would leave my family someday, but I did. In 2003, I left Mexico to come to the United States. I think that it was the worst decision that I had made in my whole life, but I didn't have a choice because I was poor." Felipe explained how he hoped for a "better life" and wanted to be able to provide for his family and how he believed immigrating to the US would provide those opportunities. Instead, like many other migrants to the US, Felipe found himself following the seasons, working in agriculture, contributing his labor to the US economy but barely earning enough to survive.

Felipe's story provides an example of the historical trends that have seen individuals from Central America and Mexico immigrate to the US for labor opportunities. However, the forces influencing Felipe and many other immigrants were not based on individual choices. Heyman (2018) argues that "unauthorized and guest-worker migrations from Mexico and Central America, and their employment in the United States, were reinforced by neoliberalism but were not a product of it. Rather, they existed before the rise of neoliberalism and contributed to its rise" (p. 221). While neoliberal forces contributed to the conditions which motivated Felipe and other LP students to immigrate to the US, these forces did not end with their incarceration.

Instead, similar forces, this time associated with English language and literacy education, operated as the students considered their life after incarceration when they would be deported. Contemplating life after incarceration, many students believed developing English language and literacy practices would provide access to more employment opportunities once back in Mexico. When asked to explain their motivations for joining LP, students responded with comments like, "Salir adelante con un buen trabajo para que tenga [sic] una familia unida y para darle un futuro mejor a mis hijos" (I want to move forward with a good job so that my family can be together and I can give my children a better future), "mi meta es aprender a hablar [sic] y escribir perfectamente y así tener un mejor empleo" (My goal is to learn to speak and write perfectly and like that I will have a better job), and "Tener un mejor trabajo en el futuro" (To have a better job in the future). Multiple students used the phrase "salir adelante," (move forward) a phrase Messing (2014) identifies as part of a metadiscourse often found in Latin America and connected with instances of linguistic assimilation and opportunities for improving a person's economic situations. Similarly, Farr (2006) connects this phrase to a "liberal individualist ideology" focused on economic and social gain through hard work.

LP instructors also argued that LP would contribute to better opportunities after deportation. In a video used in a social justice award submission, one LP instructor explained:

It [LP] provides opportunity for these guys. I believe all of them are going to get deported. So, now they have this newfound knowledge that they're able to use to find maybe better employment ... tourism. And I guess that's the jist of Language Partners. Hope.

In a conversation, another instructor shared that LP was so important:

because it doesn't only help the students to navigate the prison environment, but it also helped them when they were released. Eventually the men in the program would be deported and when they went back to Mexico, they could find better jobs in restaurants or hotels because they would be able to speak English.

For both students and instructors, developing additional English language and literacy practices would benefit students economically by providing better access to employment opportunities.

While processes of globalization and neoliberal forces initially influenced decisions to migrate to the US in search of better employment opportunities, in LP these men were being positioned to return to Mexico, again with the promise of enhanced employment opportunities, this time related to the English proficiency developed while incarcerated.

Danger of the language and literacy myth

Shortly before Felipe was released he shared some concerns about returning to Mexico saying, “I don’t have my certificado de primaria or secundaria. They will ask me for those when I want to get a job in Mexico.” He continued, “if you didn’t have those certificates you couldn’t get a job. You could get hired, but the employers will pay less,” adding that it did not matter if he spoke English. While Felipe, like many other LP students, initially joined LP and believed it would someday contribute to a better future for him, faced with the reality of returning to Mexico, he questioned the extent to which those language and literacy promises would materialize.

While LP was situated within a carceral context, the promises associated with multilingualism and multiliteracies permeate educational settings throughout society and educators and researchers need to critically question these discourses. As Ong (2006) argues, “Populations governed by neoliberal technologies are dependent on others who are excluded from neoliberal considerations” (p. 32). The exclusion of Felipe and others like him from flows of capital is not an accident, but an inherent part of the neoliberal system in which we operate. Instead of being a “great equalizer” it is imperative to consider how the promises associated with multilingualism and multiliteracies for racialized individuals contribute to maintaining a societal status quo in which racialized individuals contribute to the flows of capital but are never allowed to fully benefit from them.

In writing about literacy education in prison, Berry (2018) cautions that language and literacy researchers must “resist the romance of prison writing and prison literacies, perspectives that reduce prison writing to a good in and of itself” (p. 5). Instead, language and literacy researchers need to recognize and critique how language and literacy is intertwined with social and economic systems that have historically contributed to the exploitation of language minoritized individuals. As Gee (2015) reminds us, “The most striking continuity in the history of literacy is the way in which literacy has been used, in age after age, to solidify the social hierarchy, empower elites and ensure that people lower on the hierarchy accept the values, norms and beliefs of the elites, even when it is not in their self-interest or group interest to do so” (p. 84). To challenge this status quo, language and literacy researchers must resist the urge to perpetuate narratives that forward the idea that developing additional language and literacy practices inherently benefits all individuals equally.

False narratives of the Mexican motherland: Mexican multilingual children (re)writing their worlds

Research pertaining to culturally and linguistically diverse learners has indicated that US educators often wrongly assume that students and families of Mexican descent are uninterested in “official” academic and “prestigious” forms of literacy, with children often internalizing these deficit views (Adair et al., 2017). Even educators of Mexican descent can deficit ideologies of Mexican literacy (Murillo, 2016). As Hernandez-Zamora (2010) noted, “Since the 20th century, literacy policies and programs have been implemented on the basis of a growing rhetoric about ‘alarming levels of functional illiteracy’ in the population. Official figures in countries like Mexico count the number of ‘illiterate’ adults in [the] millions” (p. 21). When illiteracy rhetoric penetrates society and spreads, those deficit ideologies travel with individuals, including into US classrooms. A number of schools in the Midwest serve students and families that come from programs attempting to “eliminate illiteracies” (Meyers, 2014).

That illiteracy baggage became part of my (Presiado) upbringing as those deficit ideologies were transferred to me by parents who weren’t able to complete their elementary schooling. My research interests are grounded in my own lived experience as a daughter of low-SES Mexican immigrants and as a former bilingual/ESL teacher for 10 years in the Midwest. Although I hadn’t formally learned about theoretical frames and the exclusion of certain parts of US history until I was at the collegiate level, I quickly realized that those deficit narratives were false early on in life. Well aware of the rich literacy practices present in Mexican households, I set out to document and learn from Mexican American families’ home literacy practices in the Midwest, only to discover how mainstream cultural and linguistic practices and middle-class ideologies about education have penetrated Mexican immigrant homes. An interview with a participant revealed her belief in a dominant discourse that I have encountered in the field regarding education in Mexico, often coming from Mexican immigrants themselves: “La educación de México no es buena” (Mexican education isn’t good). Meyers (2014) captures this prominent theme best when addressing Mexican education, stating, “Emphasis continues to be placed on illiteracy and how this lack is harming the nation” (p. 31).

The concern of the “global outcasts”

Migration between Mexico and the United States is a unique case in the history of international migration with the presence of massive migratory flows and interdependence between nations (Durand, 2000). Within this movement, the interplay between literacy and immigration in US history has highlighted a shift from literacy being used to regulate immigration to a growing sense that literacy has to be protected from immigration and its various complexities (Meyers, 2014). Hernandez-Zamora (2010) posits

that Mexicans and by default individuals of Mexican descent, can be categorized as “global outcasts” instead of global citizens (p. 19). This stems from the fact that millions have never been treated as citizens in Mexico, with the marginalization and exclusion being more pronounced in the US. In the case of Mexico, the system of castes established with Spanish rule (1521–1821) was officially over after the Declaration of Independence in 1821, yet “we have maintained *de jure* and *de facto* structures that guarantee a caste-like society, spread out now at a transnational or global level by massive migration to the US” (Hernandez-Zamora, 2010, p. 21). Millions of descendants of the former colonized or enslaved people are now categorized as school failures, often omitted are the literacy trajectories and historical factors that have impacted marginalized individuals. In particular, Mexicans have encountered European literacy and education as instruments of conquest and colonization, economic deprivation, and cultural assimilation, and dislocation for over five centuries (Hernandez-Zamora, 2010).

Self-authoring literacy

A crucial element when reflecting back on my own lived experiences and those of the participants in my research studies, is the practice of self-authoring literacy (Freire, 1970; Hernandez-Zamora, 2010). Self-authoring literacy, goes beyond merely accomplishing daily tasks and is therefore a practice aimed at self-construction or re-construction of identities, a way to push back and write one’s place in the world (Freire, 1970; Dyson, 1993). As the presented examples will elucidate, Mexican children and children of Mexican descent in the US not only engage in multiple forms of literacy, but are often producers of powerful counter-narratives.

An awakening: reflections on Mexican children and their schooling experience in Mexico

A Latino National Survey conducted in 2006 revealed that while Midwestern Latinos are similar to Latinos in other regions of the US, the foreign born in the Midwest are more likely to have come from Mexico, particularly the states of Chihuahua, Jalisco, Michoacán, and Guanajuato (Martínez, 2011). As a bilingual teacher and researcher working in schools in the Midwest, I (Presiado) have encountered many families from Jalisco. One of my first experiences with a Mexican immigrant parent from Jalisco was listening to a mother apologize for her inability to help her child because of what she called her own “poor literacy skills,” this misconception one of many internalized by Mexicans.

To better understand the language and literacy practices in the schooling of Mexican children, I visited public elementary schools in Jalisco, Mexico, specifically in Ciudad Guzman and Mazamitla for four weeks, spending 2 weeks in each city. The ethnographic case study allowed for an in-depth investigation of how language and literacy were enacted both in the official school setting and the community. The experience was eye opening and extended beyond my own awakening, as I later shared the information with pre-service and practicing teachers in Illinois who were working with Mexican families from Jalisco, or who they themselves were from Jalisco.

Regarding school-based literacies, overall the findings aligned with previous descriptions on the emphasis of “form” and “meaning” to some extent in all classrooms with the presence of planas (the repetitive copying of individual letter, words, syllables) as an important part of early literacy instruction. I took pictures of the materials used to teach literacy, was given some artifacts both by teachers and students, collected lesson plans, conducted interviews with the teachers and administrators, and had conversations with children in addition to observing in the classrooms all day for four weeks. The materials collected out in the community were photographs, artifacts, documented conversations with student’s family members or individuals in the community.

In sharing my (Presiado) findings with pre-service teachers and practicing teachers in Illinois, educators were often surprised to learn of the expectations for teachers and the multiple ways students engaged with their multiliteracies. Many were amazed to learn of the yearly exam that Mexican teachers have to take to maintain their licensure and the rigorous preparation program for pre-service teachers. They were also not expecting to hear of the multimodal ways in which the children and their families were authoring their lives, especially when seeing pictures of the schools and communities. The stories shared about the students using smartphones to learn other languages, including English and Mandarin, to stay informed about world events was also unforeseen. Mexican teachers’ rapport with families was also revealing with technology being a major tool for communication. Shared information often extended beyond school related topics to include recipes, interesting articles, inspiring quotes, and funny memes to encapsulate life circumstances. Misconceptions were challenged when sharing students’ interviews with educators in Illinois of Mexican student’s life goals to be chefs, executives, travel agents, pet shop owners, writers and how it was intricately planned in unofficial classroom spaces by generating plans and samples. The level of complexity in multimodal literacy practices is also relevant for students of Mexican descent residing in Illinois.

Transnational literacies: re-constructing ideas of borders and knowledges

My research in the Midwest with transnational families has also impacted my perspectives pertaining to language and literacy practices. Transnationals are individuals who participate in flows and movement of people, ideas, capital and good between regions (Jiménez et al., 2015). Transnationals have regular ongoing contact in physical and digital realms with others across national boundaries. A family I worked with not only engaged in transnational practices including communicating with family in Mexico via digital technologies, upholding Mexican traditions, and having Mexican goods in the home but also engaged in regular and ongoing contact in digital forms with Asian culture.

When sharing my research with teachers in Illinois about how students of Mexican descent were engaged in exploring and engaging with Korean and Chinese culture there was a shift in thinking about “borders and knowledges.” Borders in the sense of how “borders” often indexed the relationship and boundaries between Mexico and the US to see how digital spaces have, in a sense, created bridges to explore other cultures. Taking it a step further, it was unexpected that multilinguals of Mexican descent would be interested in learning Asian languages and practices associated with art and music, when according to teachers they were still learning English. Yet the girls in this transnational family were well aware of the impact of multilingualism as one stated, “Puedo decir hola, hello, y *nĩ hã* y eso es poderoso” (“I can say hola, hello, and *nĩ hã* and that is powerful”).

Considered “global outcasts,” Mexican and individuals of Mexican descent have created their own identities that have created counternarratives to what it means to “be Mexican.” Researchers exploring the language and literacy practices of multilinguals would benefit from humanizing the populations they are examining by learning about their histories, present, and future hopes.

The cruel fallout of racism: confronting teacher candidates’ misconceptions and (re)structuring beliefs about Black language

Negative perceptions and ideologies about Black language are pervasive in educational spaces as ideological assumptions centered on race, language, and power are embedded within institutional structures. It is not surprising that deficit language ideologies about Black discourses saturate educational institutions, as society often circulate harmful rhetoric about Black linguistic identities through media outlets, such as films, television, social media and other mainstream accounts. Critical scholarship challenges misconceptions socially constructed about minoritized languages by arguing that language is essentially heterogenous, and false narratives that promote ideological linguistic hegemony reject the linguistic and cultural identities of Black American students, particularly in academic spaces. Therefore, deficit perspectives that permeate schools about Black language discourses contribute to Black students’ internalized falsehoods about their own linguistic practices (Richardson, 2003). Perhaps the most detrimental false narrative of them all encourages Black language speakers to develop “code-switching habits” in order to achieve academic success.

In (re)membering my (Frieson) lived schooling experiences, Black teachers that consistently embodied my linguistic practices was imperative to sustaining Black language in the classroom and affirming my cultural and linguistic identities. However, in my work as a teacher educator, I often observe the reproduction of deficit ideological assumptions about languages other than White Mainstream English (WME), through the curriculum, policies, and pedagogical practices in higher education spaces. As a Black faculty member and a Black language speaker, I often encourage teacher education students to confront their deficit perspectives about Black language by developing a critical consciousness to anti-Black linguistic racism and its impact on Black students. Particularly critical to this examination is the unlearning of negative ideologies and misconceptions that have been fostered about Black children’s “linguistic human rights” (Baugh, 2015). Language ideologies are often bound with goals of producing a single “legitimate” language, used as a gatekeeping mechanism to exclude socially minoritized languages (Blackledge and Creese, 2010), such as Black language. The ontological trope of ideologies derives from colonial racism (Fanon, 1967) that reproduces racial and linguistic hierarchies that demonstrate how Black discourses are undervalued resources in classrooms (Baker-Bell, 2020).

The following sections illuminate critical theoretical perspectives situated in my pedagogical practices central to the facilitation of restructuring and reframing of students’ epistemic assumptions about Black language. Not only do the subsequent conceptual understandings challenge societal misconceptions that reduce Black languages as informal tropes of expression solely fit for utility outside of school, but also calls on educators and scholars to cast a forward-looking vision of a humanizing education for Black students.

Addressing anti-black linguistic racism

The language, only the language ... It is the thing that Black people love so much- the saying of words, holding them on the tongue, experimenting with them, playing with them. It's a love, a passion. Its function is like a preacher's: to make you stand up out of your seat, make you lose yourself and hear yourself. The worst of all possible things that could happen would be to lose that language This is a really cruel fallout of racism.

Toni Morrison.

For decades, Black children have endured linguistic oppression and violence in schools (Boutte and Bryan, 2019). In contrast, white ideological ways of speaking and knowing are institutionalized and reconceptualized as the “standard” or ideal manner of communication in schools, and often go unmarked and unquestioned (Baker-Bell, 2019). This notion of standardization is often protected with arguments that advocate for “academic language”, or the language of power. As many critical scholars have previously argued, when white ways of speaking are constructed as the “standard” to which all other ways of speaking and being are evaluated, racial and linguistic hierarchies are formed where the linguistic practices of communities of Color are devalued and positioned as useless in schools (Alim and Smitherman, 2012; Baker-Bell, 2020; Frieson, 2021; Morales and Hartman, 2019). Toni Morrison referenced this exact notion in the 1981 interview with Thomas LeClair, when discussing how Black children’s language practices are disparaged in schools as a result of being told permanently damaging things about their language.

Although racialized populations who speak minoritized languages endure linguistic discrimination, *anti-black linguistic racism* references the specificity and the embodied experience of the violence and harm that Black language speakers encounter daily (Baker-Bell, 2019). As mentioned by Baker-Bell (2020, p. 2), “anti-black linguistic racism refers to the linguistic violence, persecution, dehumanization, and marginalization that Black Language speakers endure when using their language in schools and in everyday life.” Anti-black linguistic racism serves as a framework for understanding the multiple forms of violence that Black language speakers experience and how anti-Blackness fuels the harm that is experienced across various contexts.

Boutte and Bryan (2019) further outline linguistic oppression that Black children experience by defining linguistic violence as a type of anti-Black violence that includes Black language marginalization and policing “through privileging and promoting White mainstream English” (p. 6). Linguistic violence and oppression also refers to the raciolinguistic ideologies (Alim et al., 2016; Flores and Rosa, 2015) manifested by teachers who do not understand the richly complex linguistic discourses employed by Black language that surpass the single-axis “basics” that are promoted in schools (Wynter-Hoyte and Smith, 2020), demonstrating the significance of encouraging pre-service teachers to interrogate their misconceptions about Black children’s multilingualism.

Disrupting anti-black linguistic racism in preservice teacher education

Recent scholarship focused on policy implications has emphasized the urgency in creating counternarratives about multilingualism in the classroom (Seltzer and de los Rios, 2021). Aligning with research that disrupts monolingualism as the norm in the classrooms, I contend that language ideologies and anti-Black linguistic racism should be further challenged in higher educational contexts. In order to cultivate future educators who reject, “institutionalized anti-Black dispositions, policies, practices, and curricula” (Wynter-Hoyte, 2020, p. 408) and who deeply understand the nuanced richness that Black language speakers bring to the classroom, teacher educators in higher education should also examine their pedagogical practices to ensure that anti-Black linguistic violence and harm is not being perpetuated in teacher education. Therefore, the examples I (Frieson) present demonstrate how I as a preservice teacher educator and professor confront teacher candidates’ misconceptions and deficit perspectives about Black language in higher education spaces.

Every semester, I teach an undergraduate course that centers the multilingualism of children of Color. We have previously discussed the complex linguistic landscapes of multilinguals that often remain absent from curriculum and pedagogical practices in schools, and how preservice teacher candidates can reimagine how to foster a humanizing education that prioritizes the knowledge, histories, experiences, and discourses of BIPOC children. Providing an education that places the voices, lives, and literacies of BIPOC children at its core must be inclusive of critically examining, interrogating, and uprooting the historical and contemporary educational injustice perpetrated by white supremacy that has been imposed upon systematically marginalized populations.

In the course, I challenged students to reframe their ideological assumptions of multilingual children, particularly Black children considering the pervasiveness of anti-Blackness in educational and societal contexts. Many preservice teachers, including future ESL and ELA teachers, shared perspectives that multilingual children speak languages that have been institutionalized, such as English, Spanish, or French. When asked about students who speak Black language or other languages that have been systematically marginalized, many students echoed a negative perception about Black language, stating that it was “ghetto”, “slang”, and questioned if Black language was a language system. Baker-Bell (2020) mentions how teacher attitudes shaped by language ideologies contribute to the normalization and perpetuation of anti-Black linguistic racism by questioning the legitimacy of Black Language such as the perspectives shared by my undergraduate students. When preservice teachers engage in questioning the legitimacy of Black language, it also further reflects their deficit assumptions about its speakers (Alim and Smitherman, 2012).

Black language and literacy scholars have discussed the devastating impact that anti-Black linguistic racism has on Black students, such as the *linguistic push-pull* where Black students’ love for Black language is often contradicted by the rejection of Black language advanced by societal norms that promote whiteness (Smitherman, 2006). For example, when Black students internalize negative ideologies about their own language practices, their linguistic, racial, and intellectual identities are often impacted (Kirkland and Jackson, 2008). In a study conducted by Baker-Bell (2013) in a secondary advanced placement English class, students shared that they associated “low intellectual ability” and “ignorance” with Black language speakers while they identified WME speakers as “well-educated”. Moreover, research also demonstrates when Black children are taught to reject their linguistic practices, they are indirectly receiving the message that their identities and discourses don’t matter (Baker-Bell, 2020).

Normalizing Black language in preservice teacher education

To combat anti-Black linguistic racism, I (Frieson) interrogated many of my own pedagogical practices in the undergraduate course. One of the approaches implemented was a translanguage approach (García et al., 2017) foregrounded in centering multilingualism and the entirety of my linguistic repertoire as the norm. In an attempt to reframe my students’ ideological assumptions about Black language, I utilized Black language frequently and encouraged my students who knew Black language to do the same. In an effort to cultivate praxis that supported students’ rights to their own languages (CCCC, 1975), I also implemented linguistically flexible assignments where socially minoritized languages were invited, especially Black language and Spanglish. Students acknowledged that it took them time to adapt to critical praxis that located multilingualism as the norm, as the linguistic practices of multilinguals were typically not esteemed in their undergraduate coursework.

A shift that I noticed when I began to implement translanguaging and antiracist Black language pedagogy and practices, such as fluidly moving throughout my linguistic toolbox and prioritizing Black language, Black students began to also confidently utilize linguistic dexterity in their oral discourse and written assignments. For example, one of the major course assignments is a critical reading response journal where students synthesize readings and share thoughts. In the past students have only engaged in written responses; however, this year I invited students to engage in linguistic creativity by submitting audio files or artwork for their critical reading response journals. Only a few students took advantage of the offer, including two Black students, Ebony and Camille (both pseudonyms).

For Ebony's critical reading response journal, she created a podcast where she interviewed many people within her circle, including family, friends, and co-workers, about critical language and literacy topics ranging from language ideologies to Black language to translanguaging. Throughout the podcast, Ebony primarily used Black language to facilitate these critical conversations. When I asked her about her processes in creating and executing the podcast, Ebony mentioned how liberated she felt to finally be herself. Camille also created a podcast to offer critical responses to the readings. In a particular episode, she shared her astonishment with learning about the complexity of Black language in a class because as a secondary English major she had internalized the fallacy of the code-switching approach where Black language is solely utilized as a means of survival for the linguistic manipulation of learning WME (Baker-Bell, 2020). In addition, she also raised critical questions about never receiving formal education about her language practices until now and interrogated how anti-Black linguistic racism in school structures underscored her experiences.

In short, critical interdisciplinary research that further explores multilingualism centered on Black American children and youth stresses that the future of scholarship focused on Black language must address the complexity of language and race. As emphasized by Baker-Bell (2019, p. 3) "many classrooms continue to be informed by anti-black, deficit theories, and monolingual ideologies that view Black language as a barrier to Black students' literacy education.", therefore it is imperative that we interrogate policies and practices in higher education that contribute to anti-Black linguistic racism. As Toni Morrison once stated, it is essential that we are refraining from the participation of the cruel fallout of racism in denying Black students' rights to their own multilingualism.

Conclusion: looking toward radical hope

Our four different, but complementary narratives illustrate how we have employed critical perspectives that debunk misconceptions about multilingualism in our research and in our lives. Our narratives further demonstrate the process of how our participants and students grappled with misconceptions about indigenous languages (Murillo), language and literacy myths (Sosnowski), multiliteracies (Presiado), and how teaching them about their own language rights (Frieson) constructs a path forward toward radical hope. While confronting misconceptions about multiliteracies and multilingualism is challenging work for us all, it allows us to envision a future with a more-just and liberating society for multilinguals.

Introduction

As the world is increasingly characterized by mobility and fluidity, there is need for conceptualizations of language and identity that account for the complexity of social practices in the 21st century (Darvin and Norton, 2015). Increasingly, scholars are using translanguaging as a lens through which to understand the dynamism that is characteristic of 21st century languaging practices (García and Li, 2014). At the same time, poststructuralist conceptualizations of language and identity offer useful frameworks for understanding the complex relationships between identity and situated languaging choices, within existing structures of power (Norton and Morgan, 2020).

The indexical links between languaging practices and identity are foundational, and an investigation of translanguaging is incomplete without concerted attention to ways in which translanguaging both shapes and is shaped by identity. Translanguaging pushes back against standard language ideologies, monolingual normativity, and discriminatory linguistic hierarchies, ideologies that prop up systems of racism, classism, ethnic discrimination, and colonial relations of power. In so doing, translanguaging can destabilize ideologies that disproportionately marginalize people of color, people living in poverty, and communities that “have come out on the short end of the processes of nation-building, coloniality, and global capitalism” (García and Otheguy, 2020, p. 27), offering opportunities to claim more empowering and multidimensional identity options.

In this chapter, we examine relationships between languaging practices and identity across diverse global sites, exploring ways in which translanguaging practices contribute to the negotiation, construction, and transformation of identities that are dynamic, complex, polyphonic, and shifting across time and space. The chapter is organized in five sections, beginning with conceptualizations of translanguaging and identity, and then moving to Named Languages, Translanguaging, and the Productive Unsettling of Identity Categories. In this second section, we examine translanguaging as a counter-hegemonic process that disrupts restrictive identity categories, including those constructed by elitist Eurocentric ideologies of language and nationhood, enabling speakers to complicate one-to-one equations of language and identity. In the next section, Third Space and Transformation, we draw on the notion of Third Space (Bhabha, 1994) to investigate how translanguaging moves beyond previously existing identity possibilities, energizing creativity and criticality in the process of transformation, and enabling speakers to construct polyphonic identities for themselves that challenge coloniality and unequal relations of power (Shank Lauwo, 2018). In the fourth section, Identity, Investment, and Translanguaging, we examine how the construct of investment (Darvin and Norton, 2015, 2021; Norton, 2013) invigorates the study of translanguaging and identity, detailing the significance of power, ideology, and capital in shaping investment in translanguaging practices. In the final section, Translanguaging, Identity, and Pedagogical Context, we examine the importance of context in translanguaging practices and pedagogy, and compare translanguaging pedagogy in the Global South and Global North. Our discussion concludes with a caveat that addresses the conditions under which named languages may have strategic importance for policy and pedagogy.

Translanguaging and identity: conceptual foundations

Conceptualizing translanguaging

García (2009, p. 140) conceptualizes translanguaging as “the act performed by bilinguals of accessing different linguistic features or various modes of what are described as autonomous languages, in order to maximize communicative potential.” Translanguaging unsettles understandings of language as a stable, decontextualized, bounded, ahistorical system, and focuses instead on communicative practices, linguistic repertoires, and discursive resources. In so doing, translanguaging shifts the analytical gaze from languages and structures to speakers and their practices in the process of meaning making and identity negotiation (e.g., Makalela, 2016; Lin, 2019).

Translanguaging understands language as a “socially, culturally, politically and historically situated sets of features” (Guzula et al., 2016). Rather than being constrained by the social constructs of named languages, speakers make strategic use of various features of their linguistic repertoires in order to meet their communicative and identity construction goals in a particular situation. Translanguaging disrupts the idea that a “normal” or “ideal” speaker is monolingual, instead positioning multilinguals and their communicative practices as normative. While translanguaging involves “using one’s idiolect, that is one’s linguistic repertoire, without regard for socially and politically defined language names and labels” (Li, 2018, p. 19), the social dimensions of translanguaging are of utmost importance, in that there is an audience and communicative objectives. Thus, Anya (2017) frames translanguaging as “a joint, performative, improvisational social accomplishment in which interlocutors work with one another’s linguistic contribution to the interaction to anticipate and fulfill communicative needs and collaboratively construct meaning” (Anya, 2017, p. 25).

Conceptualizing identity

In this chapter, we adopt a poststructuralist understanding of identity as “the way a person understands his or her relationship to the world, how that relationship is structured across time and space, and how the person understands possibilities for the future” (Norton, 2013, p. 4). This conceptualization of identity foregrounds the complex relationships between speakers and the social world, emphasizing that neither identity nor languaging practices can be separated from the social contexts involved. Translanguaging practices contribute to the negotiation of all of these aspects of identity in important ways, including the mediation of power relations. The interdependent relationship between identity and languaging practices is acknowledged by Chris Weedon (1987), a prominent feminist poststructuralist: “Language is the place where actual and possible forms of social organization ... are defined and contested, yet it is also the place where our sense of ourselves, our subjectivity, is constructed” (p. 21).

Translanguaging and poststructuralist conceptualizations of identity share core impulses, making their pairing particularly generative. Through a poststructuralist lens, both identity and translanguaging practices are dynamic, process-oriented, and shifting across time and space. Both are understood as being fluid, hybrid, and complex; they are both negotiated in relations of power, constructed in specific sociocultural and political contexts, and represent sites of struggle.

Named languages, translanguaging, and the productive unsettling of identity categories

Translanguaging complicates one-to-one-equations of language and identity, and liberates language users from rigid identity categories frequently associated with named languages. The ideology equating one national, racial, or ethnic identity with one language was a European invention, tied to the invention of the concept of named languages, and entangled with processes of colonialism and nation building (Makoni and Pennycook, 2007). Indeed, the invention of the very concept of named languages was itself largely a product of a nationalist romanticist ideology presuming an intrinsic link between language and (national) identity (García and Otheguy, 2020; Makoni and Pennycook, 2007). As Li (2018) reminds us, named languages are really sets of structures identified and named by linguistics, with the naming and labeling generally done in collusion with “cultural-political concepts associated with the one-nation/race-one-language ideology” (Li, 2018, p. 19). The concept of named languages, and the related ideology of standard languages, was invented as a tool of domination, serving ideologies of racial, ethnic, class, and gender superiority, and the marginalization or exclusion of minoritized “Others” who do not conform to the dominant group’s languaging practices.

The nation-statist ideology of a named language representing a particular culture and geopolitical entity still pervades much language education, including foreign language education in particular. Students in foreign language classrooms are generally purported to be learning the standardized form of a named language that presumably corresponds to a specific foreign nation-state, and are being prepared to communicate with monolingual native speakers associated with a particular culture in this foreign context (Anya, 2017; García and Otheguy, 2020).

Translanguaging, as a practice and as a pedagogy, disrupts the domination and erasure embedded in one-nation-one-language ideology, and “releases histories and understandings that had been buried within fixed language identities constrained by nation-states (see Mignolo, 2000)” (García and Li, 2014, p. 20). Translanguaging also pushes back against raciolinguistic ideologies that grant legitimacy only to the linguistic and cultural practices and knowledge systems stereotypically associated with white monolingual people, and legitimizes the languaging practices, knowledges, and abilities of communities who have been racialized through processes of colonialism (García et al., 2021). In this way, translanguaging contributes to the unsettling of both linguistic and racial

categories (and their co-naturalization), as part of broader struggles toward decolonization and the dismantling of white supremacy (Rosa and Flores, 2017).

One compelling illustration of how translanguaging can powerfully and productively deconstruct racial and ethnic categories comes from Kerfoot and Bello-Nonjengele's (2016) ethnographic work in a multi-racial, multi-ethnic, multilingual school near Cape Town, South Africa. The school, attended by an unusual combination of Black African and colored students, is described as "a site in which 'what was once thought of as separate—identities, spaces, histories—come together or find points of intersection in unexpected ways' (Nuttall, 2009: 10)" (Kerfoot and Bello-Nonjengele, 2016, p. 453). They document how children's languaging practices disrupt the ways in which relationships between language, ethnicity, and "race" had previously been enforced and naturalized, as children "conscious[ly] and strategic[ally] use their semiotic repertoires as identity-building resources" and to negotiate power hierarchies (Kerfoot and Bello-Nonjengele, 2016, p. 468). Children's strategic identity choices, including the "mother tongue" they choose to assign to themselves for language of instruction placements, are "often in conflict with parental ideologies, subverting essentialist notions of linguistic ownership" (Kerfoot and Bello-Nonjengele, 2016, p. 468). They demonstrate how the "decoupling of the links between linguistic forms and social categories, the basis of apartheid policies, has fundamental implications for current language-in-education policies still based on essentialized understandings of ethnicity, race, and language" (Kerfoot and Bello-Nonjengele, 2016, p. 469).

In a different South African context, Nkadimeng and Makalela (2015) note how translanguaging supported multilingual high school students in Soweto to use the "hybrid language space to identify and ethnify—choosing who they want to become beyond traditional linguistic and exact ethnic affiliations" (p. 7). In a context where boundaries between both languages and ethnic identities were prescribed by colonial forces (see section on *Translanguaging, Identity, and Pedagogical Context*), the hybridization of linguistic practices and ethnic affiliations has a decolonial character. In these ways, translanguaging can productively disrupt ideologies of nationhood, colonialism, and race/ethnicity that naturalize parallel borders around languages and social categories, creating space for both hybridity and transformation.

Third space and transformation

Translanguaging practices can expand imaginations of what is linguistically and epistemologically possible, opening space for the emergence of new identities and ways of being. As Li (2018, p. 26) notes, human social interaction is overwhelmingly characterized by "alternation between languages, spoken, written, or signed; between language varieties; and between speech, writing, and signing". These normative practices "construct an identity for the speaker that is different from a La identity or a Lb identity" (Li, 2018, p. 26).

While translanguaging practices are expressions of hybridity, they also go beyond hybridity to create novel languaging practices. The concept of Third Space (Bhabha, 1994) accounts for the way translanguaging goes beyond combining existing communicative and cultural possibilities, to create a generative space characterized by transformation and creativity. Gutiérrez (2008) understands Third Space as "a transformative space where the potential for an expanded form of learning and the development of new knowledge are heightened" (p. 152). Drawing from Soja (1996), Li (2018) conceptualizes a translanguaging Third Space as "a space of extraordinary openness, a place of critical exchange where the geographical imagination can be expanded to encompass a multiplicity of perspectives that have heretofore been considered by the epistemological referees to be incompatible and uncombinable" (pp. 23–24).

Significantly, a Third Space also enables expanded imaginations of identity possibilities, opening space for the creative combination of identity features previously considered to be "incompatible and uncombinable". Shank Lauwo and Loth Mollel (forthcoming) detail how the Third Spaces created through practices of translanguaging and multimodality in a Tanzanian community library support children to embrace the complementarity of seemingly disparate identities, languaging practices, cultures, and values that they perform and embody in in-school and out-of-school contexts. In this context, translanguaging helps children to find ways of bridging the worlds and challenging damaging hierarchies between languages, cultures, and knowledges that are constructed as bordered and existing in spatial isolation.

Another example of transformed identity possibilities enabled by a translanguaging Third Space comes from Flores and García's (2013) study of translanguaging practices at a New York secondary school of Spanish-speaking immigrant adolescents. Flores and García (2013) examine how a bilingual teacher juxtaposes Latin American hip-hop and American pop music to support her students to explore complex political-historical social justice issues relating to US imperialism and the propping up of violent dictatorships. In so doing, the class creates a translanguaging Third Space that facilitates students' language learning, investment, and critical engagement, as well as the development of complex ethnolinguistic identities. "A linguistic third space is developed in the interaction between a language (Spanish) and style (hip-hop) with which students are more familiar, and a language (English) and style (pop) which are less known. Thus, students not only cross national and linguistic borders (Rampton, 2006) but go beyond them" (Flores and García, 2013, p. 252). This linguistic, cultural, and geographical Third Space moves beyond blending, resulting in the emergence of trans-features and trans-identities: "putting Spanish and English alongside each other, many times with features that are 'trans'—blends of both—starts to construct an ethnolinguistic identity that is not solely Latin American and Spanish monolingual, and not solely Anglo US and English monolingual, but a US Latino bilingual identity" (Flores and García, 2013, p. 248).

We thus see the transformative power of translanguaging, as it transgresses existing possibilities and opens space for the emergence of new identities and communicative practices, as well as transformed power relations, epistemological possibilities, and social structures. [Shank Lauwo \(2018\)](#) demonstrates how “the practice of translanguaging offers tremendous transformative power, through its ability to reconfigure entrenched power hierarchies between languages and their speakers” (p. 144). [García and Li \(2014\)](#) describe the transformative nature of translanguaging thus:

as new configurations of language practices and education are generated, old understandings and structures are released, thus transforming not only subjectivities, but also cognitive and social structures. In so doing, orders of discourses shift and the voices of Others come to the forefront, relating then translanguaging to criticality, critical pedagogy, social justice and the linguistic human rights agenda (p. 3).

The transformative power of translanguaging, which makes it a potent tool for social justice, is tied to its relationship with creativity and criticality. Translanguaging, as a perpetually emergent languaging practice that is characterized by dynamism and innovation, is an inherently creative practice. Unconstrained by prescriptive linguistic norms, translanguaging enables constant engagement with communicative *options*, with playful experimentation with new possibilities, and therefore invites the constant renegotiation of identities, values, and perspectives. Translanguaging practices, inasmuch as they push back against established relations of power and top-down impositions of linguistic norms, are also inherently critical. Criticality, which interrogates power relations, questions the status quo, and seeks more just alternatives, is deeply tied to creativity, and both are essential to imagining and constructing more equitable futures. As [Li \(2018\)](#) contends, “From a Translanguaging lens, multilingualism by the very nature of the phenomenon is a rich source of creativity and criticality, as it entails tension, conflict, competition, difference, and change in a number of spheres, ranging from ideologies, policies, and practices to historical and current contents” (p. 23). Creativity and criticality through the practice of translanguaging enable speakers to transcend received identity possibilities that may be experienced as bordered or limiting, and to creatively and critically construct alternative identities for themselves, individually and collectively, that may be experienced as more empowering, responsive to shifting circumstances, and in service of the imagined futures in which they are invested.

Transformation and polyphonic identities

Translanguaging gives voice to the complexity and multivalent nature of multilinguals’ identities, identities described elsewhere as “polyphonic” ([Shank Lauwo, 2018](#)). The term polyphony describes a musical texture in which multiple melody lines are featured simultaneously. Conceptualizing identities as polyphonic points to the ways in which “identities, like languages, are not discrete, bordered, nor mutually exclusive, but can be complementary, interwoven, and interdependent” ([Shank Lauwo, 2018](#), p. 141). Multiple dimensions, or voices, of our polyphonic identities are simultaneously audible in any languaging act or semiotic expression we may make. Sometimes certain melody lines, or identity features, are foregrounded, while other times various identity features are equally pronounced as part of a complex and interdependent whole. Sometimes identity features co-exist and intermingle harmoniously, while other times they create dissonance, producing tension, and perhaps competing for dominance. Significantly, while different melody lines, or identity dimensions, may have different features or characteristics that previously moved independently, in polyphony these melodies/identities are experienced as one dynamic, new whole, with a continuously evolving progression of harmonies, dissonances, and complexities.

For multilinguals, these polyphonic identities are creatively expressed—and, indeed constructed—through translanguaging, which carries these dynamics of harmony and dissonance, tension and competition, and the emergence of something new. Indeed, translanguaging practices, like identities, are also polyphonic, and sometimes linguistic features associated with a particular named language may be dominant, while at other times the features may carry so many linguistic influences simultaneously that they defy categorization. Important to both polyphony, or any form of music, and translanguaging is the dimension of time. Translanguaging, like music, is a temporal expressive medium, utilizing the resource of time in the expression and construction of identities. Because of this temporal dimension, translanguaging practices, like polyphonic identities, by their very nature are ever-changing, shifting over the course of a conversation, or a day, or a lifetime. Any given excerpt of expression of our polyphonic identities is necessarily partial, relying on everything that came before and everything yet to come for its ever-elusive completion.

Translanguaging spaces help to nurture these polyphonic identities, offering opportunities to negotiate the complementarity and mutual interdependence of diverse identity dimensions. Indeed, one of the goals of translanguaging pedagogy is “to create a space in which these multiple identities can be brought productively into conversation with each other” ([Shank Lauwo, 2018](#), p. 141), in order for speakers to “[bring] together different dimensions of their personal history, experience and environment, their attitude, belief and ideology, their cognitive and physical capacity into one coordinated and meaningful performance” ([Li, 2011](#), p. 1223).

Identity, investment, and translanguaging

In addition to supporting the creation of linguistic and epistemological Third Spaces and the affirmation and expansion of polyphonic identities, translanguaging can support learners’ investment in learning. Investment, understood as a sociocultural

complement to the psychological construct of motivation, occurs when learners perceive their identities to be valued, their cultural capital is positioned as a resource, and the ideological environment of the learning space is supportive of the learner (Darvin and Norton, 2015, 2021). If learners invest in learning particular languaging practices, they do so with the understanding that they will acquire a wider range of symbolic and material resources, which will in turn increase the value of their cultural capital and social power (Norton, 2013). While a learner might be highly *motivated* to learn, they may struggle to be *invested* in learning if the learning environment devalues their languaging practices, culture, or identities, or if it is, for example, racist, classist, patriarchal, or homophobic. This section examines intersections between translanguaging, identity, and investment in learning, by addressing themes of power, ideologies of legitimacy, cultural capital, and imagined identities and imagined futures.

Power

At the heart of translanguaging's transformative power is its ability to shift relations of power, enabling those who are the most marginalized by monoglossic and standard language ideologies to claim agency as legitimate knowers, speakers, and knowledge producers. Translanguaging enables those with rich languaging practices to shed ascribed identities as multilingual "Others" and position themselves as agential communicative subjects. Translanguaging is a potent act of resistance to ideologies that privilege monolingualism and that grant greater power to certain languages (such as English) and language varieties, thereby shifting power relations between both languages and their speakers (Shank Lauwo, 2021). Indeed, as García and Otheguy (2020) assert, translanguaging pedagogy has the development of agency as a central emphasis: "Translanguaging pedagogy ... focuses on building the agency of the learner to language in order to act and mean as a bilingual" (García and Otheguy, 2020, p. 28). Certainly, relations of power have significant implications for learners' investment in their learning, and the identities they are able to adopt in the process of learning (Darvin and Norton, 2015).

The story of Namelok, a 10-year-old Maasai girl in rural Tanzania who had never been to school, illustrates how the transforming of power relations enabled by a translanguaging space can ignite possibilities for investment in learning and the expansion of identity options (Shank Lauwo, 2019). Fearful and timid in her initial interactions with a multilingual community library, the positioning of her dominant language of Maa as an asset in multilingual games meant that other children, who had previously belittled her abilities, clamored to have her on their team. The decentring of the hegemony of Kiswahili and English and of the written word offered her space to engage with books through picture reading and begin authoring her own stories through drawing and oral narrations. As her confidence grew through these successful literacy experiences, Namelok, on her own initiative, began teaching Maasai songs and Maa vocabulary to other children and to facilitators, and punctuating her picture reading with newly-learned English words. She led a group performance of singing and dancing, and comforted a girl in distress by orally narrating her own rendition of a picture book to her. In these ways, the translanguaging space enabled Namelok, who would have been marginalized by the monolingual Kiswahili and written-word-centered environment of formal schooling, to invest in the learning space and to claim identities as a knower, language expert, author, valued team member, reader, English speaker, teacher, leader, and helpful friend. Indeed, her new-found confidence enabled by the valorization of her full linguistic, cultural, and semiotic repertoires supported her investment in the library's language and literacy activities, thereby unleashing her creative agency, and enabling her to practice skills that could lead to expanded literacy abilities in the future (Shank Lauwo, 2019).

Ideologies of legitimacy

Ideology pertains to systemic patterns of control, often invisible, that shape our thinking and behavior based on a normative set of ideas (Darvin and Norton, 2015). These systemic patterns of control can both constrain and/or enable investment, as they can also facilitate or inhibit possibilities for a learner to position themselves as a legitimate speaker (Bourdieu, 1991). With regards to legitimacy of speech, Bourdieu (1977) posits that,

Just as, at the level of the relations between groups, a language is worth what those who speak it are worth, so too, at the level of interactions between individuals, speech owes a major part of its value to the value of the person who utters it (p. 653).

Translanguaging offers opportunities to transgress ideologies that limit access of certain people in certain contexts to identities as legitimate speakers, opening space for all people to claim identities as legitimate speakers, knowers, and knowledge producers. Specifically, translanguaging pushes back against ideologies of native speakerism and of distinctive L1 and L2 identities, to acknowledge and valorize linguistic resources and processes of language acquisition that defy categorization into countable and chronological units.

Pedagogically, translanguaging can deconstruct orders of value of various named languages, languaging practices, and speakers, and construct alternative ideologies in a particular classroom or learning environment. When learners' identities, languaging practices, and efforts at learning new communicative practices are valued and positioned as legitimate, this sense of legitimacy enables learners to invest in the languaging practices of a given learning/communicative environment. Supporting learners to utilize their full linguistic, cultural, and semiotic repertoires in a learning environment acknowledges their agency as legitimate communicators, even when their proficiency in the 'target' language or languaging practices may still be emergent.

Significantly, classrooms or learning environments exist in broader structures of power that “construct modes of inclusion and exclusion, and [position] learners in multiple ways before they even speak” based on “embodied identities inscribed by race, ethnicity, gender, and social class” (Darvin and Norton, 2015, p. 43). While pedagogy alone may not be able to address systemic patterns of control at the macro level, it can prompt ideological shifts at the micro level, with long-term ramifications for learners’ investment and the expansion of their identity possibilities, in the classroom and beyond.

Capital

As Darvin and Norton (2015) note, capital is essentially about power, and, drawing on Bourdieu (1986), includes economic, cultural, and social capital. Language is a form of cultural capital. The extent to which learners’ linguistic or cultural capital is valued—including their languaging practices, their prior knowledge, and their diverse semiotic and cultural practices—impacts their ability to invest in learning in a given context. As Darvin and Norton (2015) argue,

learners invest in particular practices not only because they desire specific material or symbolic benefits, but also because they recognize that the capital they possess can serve as affordances to their learning. The valuing of their capital is an affirmation of their identity, a legitimization of their rightful place in different learning contexts (p. 46).

When certain forms of capital are recognized and valued in a particular field (such as a classroom), they become symbolic capital (Bourdieu, 1986). The challenge then is to create a learning environment that positions all learners’ cultural capital as symbolic capital, in order to support their investment in learning. Translanguaging spaces can support this investment, be it through valuing learners’ out-of-school translanguaging practices as linguistic capital, or supporting the fluid use of learners’ full linguistic repertoires alongside the new linguistic features they are engaged in appropriating.

The South African children in Kerfoot and Bello-Nonjengele (2016), described above, demonstrate how translanguaging practices, as counter-hegemonic processes, can shift the value of linguistic capital and rupture entrenched language hierarchies, creating new possibilities for investment and identity negotiation. Kerfoot and Bello-Nonjengele (2016, p. 469) observe that, “The frequent reordering of expected Afrikaans >English>Xhosa hierarchies, the harmonious use of isiXhosa, English, and Afrikaans in working on school tasks, the egalitarian multilingual exchanges, all work to revalue linguistic capital both in the classroom and outside it.” Significantly, it was the children, far more than teachers, the school, or educational policies, who were able to shift the ways in which linguistic features were attributed value and circulated, and were the principal agents in the contestation and renegotiation of rates of exchange of different forms of linguistic and cultural capital, including “race”, ethnicity, and gender. These children’s translanguaging practices usher us toward ideologies of post-racial solidarity, the reordering of economies of meaning, and pedagogical possibilities that support investment through the reimagination of restrictive identity categorizations.

Imagined identities and imagined futures

Certainly, learners’ investment in learning particular languaging practices is entangled with what communities they aspire to be members of in the future. Imagined communities refer to groups of people with whom one aspires to be affiliated, even when there is little immediate affiliation for a given person (Kanno and Norton, 2003; Norton and Pavlenko, 2019). Such imagined communities that might compel learners to invest in certain languaging practices might include a professional network, a sporting community, a community interested in a particular kind of music, or a religious community. An imagined community assumes an imagined identity, and learners invest in language learning in hopes of realizing these imagined identities and imagined futures (Norton, 2013).

Translanguaging supports learners to imagine diverse futures that may be less accessible in a monoglossic environment. While the learning of English, even in a monolingual space, may expand what is socially imaginable for many learners, and grant them access to an imagined community of international English speakers, translanguaging supports the multidimensionality of these imagined futures, and creates imaginative space for the complementarity of various future aspirations. Translanguaging also enables learners to use English features in their repertoires to position themselves as English speakers (an identity that may be crucial to their imagined futures), while drawing from their entire linguistic and semiotic repertoires to ensure the fullness of their intended meaning-making.

For example, Shank Lauwo (2018, 2019) documents how a translanguaging space supported Tanzanian children to use diverse linguistic and semiotic resources to imagine multidimensional futures for themselves. In an identity text of how she imagined herself in the future (see Fig. 1), Happiness introduced herself with a scripted, school-learned English paragraph, that concluded with the (predominantly Kiswahili) sentence, “Ndoto zangu kuwa Doctor” (“My dreams are to be a Doctor”). Happiness’ use of English positions her as someone who is well-educated, and signifies the centrality of English proficiency to her aspiration of becoming a doctor. She drew a girl (presumably herself) outside of a beautiful house, and used a combination of Kiswahili and Maa to write prayers for God to help her become a doctor. She also wrote creative transcriptions of the lyrics of a famous English song, which she titled “Wimbo wa Kiingereza” (“English song”—in Kiswahili). Happiness thus used diverse linguistic and semiotic resources (features from Maa, Kiswahili, English; drawing, writing, and music) to construct identities as a doctor, a Christian, a school-educated person, and Maasai, thus creating the unambiguous message that these linguistic and semiotic features and these identities can co-exist in complementarity.

Fig. 1 Happiness' Identity Text. Reproduced with permission from Shank Lauwo, M., 2018. Power, literacy engagement, and polyphonic identities: translanguaging in a Tanzanian community library. *South. Afr. Ling. Appl. Lang. Stud.* 36 (2), 133–146.

In a similar future-oriented identity text (see Fig. 2), Daudi used both Kiswahili and Maa to express his dream to be a teacher in order to teach reading and writing in Maa—a transformative ambition, as Maa, his dominant language, had been actively muted in his formal schooling experiences. He used drawings and inscriptions in Kiswahili, English, and Maa to depict various in-school and out-of-school activities, signifying the importance of all these languages to a range of activities and to his ambition. Translanguaging enabled Daudi to simultaneously imagine himself as a highly-educated professional and to transgress his received images of what such a professional does, as he brought together his Maa-speaking identity, his passion for literacy (taught in Tanzanian schools in Kiswahili and English only), and his ambition to become a literacy teacher.

Taken together, the employment of translanguaging in the examples of Namelok, South African school children, and Happiness and Daudi illustrates how translanguaging can support language users to claim power and identities of legitimacy, and to assert the value of their cultural capital in ways that enhance their investment in both learning and reimagined social futures.

Translanguaging, identity, and pedagogical context

While translanguaging has immense transformative potential, it always occurs in particular communicative contexts. Context plays a central role in shaping, not only translanguaging practices themselves, but also their significance for identity and pedagogy. As Anya (2017, p. 25) notes, a translanguaging perspective posits that languages “cannot be separated from the persons and social contexts involved”. Further, power relations between different languaging practices and their speakers shape the meanings associated with translanguaging, and the identities constructed through translanguaging in specific contexts. These power relations shift dramatically across time and space, including across Global South and Global North contexts.

In the Global South, McKinney and Tyler (2019) remind us of the situated nature of translanguaging when they insist that “no communicative practice is by definition transformative (or constraining)” (McKinney and Tyler, 2019, p. 146). In her commentary on a 2019 special issue in *Language and Education* on “translingual and transmodal complexity” in the Global South (Prinsloo, 2019), Zavala (2019) asserts,

Translanguaging pedagogy is not an essential or an absolute good ... Translanguaging pedagogy works differently in different contexts, as happens always with language use, where there is no direct connection between form and function. When we research language use in specific contexts—within a situated language approach – functions change all the time and in non-predictable ways (p. 175).

Fig. 2 Daudi's Identity Text. Reproduced with permission from Shank Lauwo, M., 2018. Power, literacy engagement, and polyphonic identities: translanguaging in a Tanzanian community library. *South. Afr. Ling. Appl. Lang. Stud.* 36 (2), 133–146.

Translanguaging in many Southern contexts, including South Africa, has an important decolonial character. South African scholars of translanguaging highlight the colonial invention of African languages, detailing how 19th century colonial missionary linguists named, codified, and standardized African languaging practices to produce discrete “languages” that reflected European ideologies of one-language-one-culture (e.g., Makalela, 2015a, 2016; Prinsloo and Krause, 2019). Apartheid policies further entrenched these linguistic distinctions by separating Africans into “homelands” or “Bantustans” based on perceived language differences, while the post-Apartheid government has “clumsily retained this earlier commitment to discrete languages” (Prinsloo and Krause, 2019, p. 164) by further institutionalizing the differences, including with the declaration of nine distinct “African languages” as official languages (Makalela, 2015a).

Currently, the languaging practices dominant in many South African townships are profoundly hybrid and fluid, representing “disruption and simultaneous recreation of new linguistic and social identities in these multilingual complex spaces” (Nkadameng and Makalela, 2015, pp. 10–11). Nkadameng and Makalela (2015) demonstrate that, for many urban Black South African youth, there is no correspondence between their ethnic and linguistic affiliations, as their linguistic repertoires are intensely hybrid and pluralistic, involving features associated with sometimes eight or more named languages. In this context, the concept of mother tongue loses currency, and the monolingual ideology behind the notion of mother tongue, presuming every person to have a single dominant language and constructing the monolingual child as normative, has little meaning in this context (McKinney and Tyler, 2019). Nkadameng and Makalela (2015) document how youth use diverse languaging practices to move across various ethnic and social identities, demonstrating processes of mother tongue disaffiliation, ethnic re-affiliations, blurring of identity boundaries, and resistance to monoglot identities. These hybrid languaging practices deconstruct the rigid ethnic and racial categories used to separate people under apartheid, and create fluid social spaces characterized by creativity and criticality, enabling speakers to choose who they want to be in any given discursive interaction (see Kerfoot and Bello-Nonjengele, 2016; Makalela, 2015b; Prinsloo and Krause, 2019).

Leketi Makalela’s influential framework of ubuntu translanguaging demonstrates how fluid languaging practices reflect African ways of knowing and making sense of the world, including African epistemological orientations toward confluence, interdependence, and incompleteness (e.g., Makalela, 2015b, 2016). Pedagogically, the normative nature of such fluid languaging practices points to the need to position translanguaging resourcefulness as both an invaluable resource in learning, and as an educational

goal, with a long-term objective being to undermine the hegemony of standard language ideologies in broader society (McKinney and Tyler, 2019; Prinsloo and Krause, 2019).

While in many contexts of the Global South, current expressions of linguistic diversity have deep historical roots (as with the South African example above), in much of the Global North, current experiences of superdiversity (Vertovec, 2007) are largely the result of exponential increases in global migration flows, in addition to the enduring presence of a rich diversity of Indigenous languages and cultures. These rapidly proliferating global migration flows, resulting in rapid increases in linguistic, cultural, and racial pluralism, are characterized particularly strongly by South-to-North migration, as processes of global capitalism and (neo) colonialism make many Southern contexts increasingly unlivable. Translanguaging in the Global North is thus frequently related in some way to transnationalism, involving combinations of linguistic features that have traveled considerable distances. In many North American contexts, for instance, translanguaging practices typically involve some linguistic features associated with English (which has come to be the dominant named language of North America after traveling considerable distances itself, and being constructed through processes of translanguaging), and linguistic features associated with more recent histories of migration. Thus, for many speakers, translanguaging practices are indexical of complex transnational identities. For example, the teachers and students featured in Flores and García (2013), described above, engage in translanguaging to negotiate “transcultural and transnational Pan-Latino US identities” (p. 251), engaging with linguistic, semiotic, and cultural features from various Latin American contexts and from the United States. In a different example, Sayer (2013) describes how second grade students’ translanguaging, involving features associated with both standard and local vernacular varieties of Spanish and English, indexes identities as Mexican, American, and Tejano simultaneously.

A caveat: affordances of named languages

While translanguaging can be an empowering resource for communication, pedagogy, and identity negotiation, in certain instances there are strategic reasons for upholding notions of bordered, named languages (Doherty et al., *in press*). In some contexts, certain advocacy objectives (such as more privileged positioning in curriculum or policy, heightened access to publishing opportunities, etc.) rely on strategic constructions of named languages, particularly for language features with less proximity to power. Also, as Creese and Blackledge (2015) point out, “If languages and identities are socially constructed, we nevertheless need to account for the fact that at least some language users, at least some of the time, hold passionate beliefs about the importance and significance of a particular language to their sense of ‘identity’” (p. 25).

Sheris et al. (2019) document one instance in which ideologies of named languages may have strategic importance. They examine the paradox of needing to simultaneously construct Safaliba, a minoritized Ghanaian language, as a bordered language for status-raising advocacy such as inclusion in school curriculum, and to validate the translanguaging practices that are the norm in the Safaliba-speaking community. Their analysis points to ways in which descriptive linguistic analysis, based on mostly static or normed notions of language, might productively co-exist with fluid, dynamic languaging practices and poststructuralist language ideologies, for gains in both advocacy and pedagogy. Indeed, this seemingly paradoxical approach can result in increased status associated with Safaliba-speaking identities while affirming the identities associated with translanguaging. Again, the role of power is significant, as this status-raising advocacy may be particularly crucial for language features positioned as less powerful in society.

While in some contexts, advocates of language preservation argue that translanguaging further erodes the already precarious position of minority languages (see Nguyen, 2019 for a Vietnamese example), in some contexts translanguaging may contribute to the preservation of linguistic features that would otherwise be further endangered. As Li (2018) notes, while Teochow and Hokkien, as bordered entities, are quickly disappearing in Singaporean Chinese communities, many features associated with Teochow and Hokkien are being dynamically incorporated into the languaging practices of Singaporeans, thereby preserving words and expressions that might otherwise be lost.

Conclusion

As we have demonstrated, translanguaging as a pedagogy and as a counter-hegemonic practice has much potential to disrupt limiting and prescriptive identity categorizations, empowering speakers to generate novel and complex identity possibilities as individuals and as communities. As a bottom-up process characterized by creativity, criticality, and transformation, translanguaging enables speakers to create a linguistic, cultural, and epistemological Third Space. This Third Space, as a generative space of innovation and newness, unleashes creative agency to imagine an expanded range of identities across time and space, and to negotiate imagined futures of both individuals and society. Significantly, translanguaging, as a pedagogy and as a practice, supports an orientation of complementarity, in which diverse aspects of a person’s background, beliefs, community affiliations, ideological orientations, and aspirations can co-exist and be simultaneously audible, in shifting ways, as part of their complex polyphonic identities. Pedagogically, translanguaging shifts relations of power and creates space for the valorization of learners’ diverse identities and cultural capital, opening opportunities for investment in learning and knowledge production.

Importantly, while the nurturing of translanguaging spaces in classrooms can have a transformative impact on power relations, investment, and identity possibilities, the broader goal is to transform systems of inequity, and their attendant discriminatory ideologies, in society at large. Translanguaging on its own (or any pedagogical intervention for that matter) cannot dismantle systems of capitalism and white supremacy, nor bring about the transformative redistribution necessary to address the material bases of inequity (Block, 2018; Fraser, 1995). Rather, translanguaging, and broader efforts towards more equitable and pluralistic education, must be situated within broader social and political economic struggles to dismantle the global systems of racial capitalism that produce inequity, poverty, and injustice (see Kubota, 2016; Rosa and Flores, 2017).

As we work toward reimagining and reconstituting global systems as we know them, translanguaging practices—and the rich complexity of world views, identities, and cultural and epistemological possibilities these construct—will continue to creatively and critically invigorate decolonial, antiracist resistance to the status quo. Our challenge is to continue to cultivate translanguaging spaces that support us to collectively imagine and construct futures that are more equitable, and that embrace the complexity of human identities.

Introduction

In his seminal book, *Pedagogy of the Oppressed*, the Brazilian educator [Paulo Freire \(1970\)](#) argued that education is a political act where teachers and learners become aware of inequalities and take actions to change unjust conditions for the purpose of individual and collective liberation. For him critically conscious persons and communities “denounce the structures of oppression” and plan for a less unjust world ([Freire, 1993](#), p. 115)—one that does not subjugate but rather strives for humanization. In historically dehumanizing educational systems, oppressive structural policies include students segregated in academic tracks, separated by home and school language, taught Eurocentric world views and conventions, and exposed to a banking model of education with deposits of teacher knowledge held accountable to normalized and standardized criteria valued by dominant groups. These systems of oppression have existed in tandem with colonial expansion, settler colonialism of indigenous communities, gender binaries, and transatlantic slavery. In systems of dehumanization and oppression learners are led to accept racial and linguistic hierarchies and deficit views of specific languages and language speakers. Left untapped in oppressive systems are the underappreciated hidden literacies ([Martínez-Roldán and Fránquiz, 2009](#); [Villalva, 2006](#)) and meaningful activities that learners from subjugated communities, such as Latinx students in border communities, deploy in and outside classrooms.

The Funds of Knowledge theory and method ([González et al., 2005](#); [Moll et al., 1992](#)) counters systems of oppression and their deficit views of subjugated peoples. It does not accept segregated tracks, home-school separations, and the privileging of dominant norms in language and literacy education. Instead, the Funds of Knowledge approach advocates for understanding the languages and literacies of less known communities such as working-class migrant communities in order to integrate and build from these out of school funds in educational settings. The Funds of Knowledge approach emerged in the Southwestern region of the borderlands between the US and Mexico, “as part of a range of social justice efforts in education aimed at making the curriculum and learning more equitable and engaging for students from historically marginalized communities” ([Esteban-Guitart et al., 2019](#), p. 2). From this perspective, the Funds of Knowledge approach actively seeks to challenge deficit viewpoints by changing teacher – student relationships and minimizing the passive learning activities of banking education. Instead, many affordances for active learning in schools builds on students’ experiences from their homes and communities. Because schools too often attempt to build academic language and literacy in English to the exclusion of the powerful hidden literacies and translanguaging practices of youth, scholars argue for seeking, recognizing, and incorporating hidden funds of knowledge ([Martínez-Roldán and Fránquiz, 2009](#)) in school curricula to boost youths’ interest in furthering their education.

In the following sections we first define a Funds of Knowledge approach and describe ways the research literature has applied and amplified original explanations through studies conducted in the United States and abroad. We show how a Funds of Knowledge approach has been utilized for subject area learning in kindergarten through high school settings. These sections lead to studies that show ways a Funds of Identity approach was developed in order to address how learners absorb and create identity artifacts from their social worlds and their household’s Funds of Knowledge to actively define themselves in and across social environments. We take the reader through the definition of a Funds of Identity approach and describe ways the research literature has more recently applied and amplified this definition and its relationship to Funds of Knowledge through empirical studies. We conclude with implications for research and teacher educators who are interested and invested in appropriating the Funds of Knowledge and Funds

of Identity approaches in planning humanizing research (Paris and Winn, 2014) and humanizing pedagogies (Fránquíz, 2012; Fránquíz and Salazar, 2004; Salazar, 2013) to support the language and literacy development of all students.

Defining a funds of knowledge approach

A Funds of Knowledge approach seeks to make visible the bodies of knowledge including language that have strategic importance in students' households (Vélez-Ibáñez and Greenberg, 1992). More specifically, Funds of Knowledge is defined as "historically accumulated and culturally developed bodies of knowledge and skills essential for household and individual functioning and well-being" (Moll et al., 1992, p. 133). This approach "builds upon the sociocultural realities of students' lives, examines socio-historical and political dimensions of education, and casts students as critically engaged, active participants in the co-construction of knowledge" (Salazar, 2013, p. 128). Stated differently, McKinney (2017) argued that young learners from nondominant backgrounds ought to be viewed as resourceful and legitimate no matter where they live. Based on her work in South Africa, she proposes that language and literacy education in schools ought to treat "all students as creative multilingual and multi-dialectal language users, critically aware of the relationship between language and power" (McKinney, 2017, p. 139). Thus, living between linguistic borderlands ought to be considered in all humanizing educational projects.

In order to design more inclusive, affirming, and sustainable language and literacy instruction for multilingual and multidialectal children living in the transnational borderlands between the US and Mexico borders, a Funds of Knowledge framework was intentionally applied from the 1980s forward (González, 2006). From its conception, researchers and teachers valuing a Funds of Knowledge approach documented the skills and knowledges within local families with the underlying premise of building mutual trust, or *confianza*, between caregivers in students' homes and their teachers at schools. Rather than accept subtractive discourses and assimilationist practices historically promoted in many urban, suburban and rural schools across the United States (Arce, 2004; Fitts et al., 2008; Weisman and Hansen, 2008) the purpose of studying students' familial and local community Funds of Knowledge was for teachers to continually draw on these resources to advance emancipatory language and literacy practices (González et al., 2005; Rodríguez, 2013) in their classrooms. Empirical studies documenting such practices have appeared in research literature reviews.

Research literature reviews on funds of knowledge

There are at least five research literature reviews conducted with the Funds of Knowledge framework applied in K-12 education. Hogg (2011) identifies the sources from homes that align with school content. The Rodríguez (2013) review takes up notions of power and agency within pedagogical dimensions including the Community Cultural Wealth framework (Yosso, 2005). Llopert and Esteban-Guitart's (2017) literature review focuses on how students' formations of identities relate to Funds of Knowledge. Specifically, the two authors describe strategies and resources to contextualize the curriculum based on processes of students' identity work within the Funds of Knowledge approach. Continuing the work begun by Hogg (2011), Llopert and Esteban-Guitart (2018) also review the literature on Funds of Knowledge published from 2011 to 2015 in order to highlight what content, curricular subject, educational level, and the scope of countries in which empirical research was carried out. They also discuss some of the tensions in using the Funds of Knowledge approach as well as including issues involved in teacher education. More recently, the review by Denton and Borrego (2021) involved an extant body of research studies that included identifying, designing, teaching and learning in the STEM areas from a Funds of Knowledge approach. These reviews acknowledge Vélez-Ibáñez and Greenberg (1992) as originators of the Funds of Knowledge trailblazing concept. Their research on the economic system of interchange among Mexican households showcased strategies of working-class families not just for surviving, but achieving a strong measure of success in diverse occupational and social settings that was emulated in diverse educational contexts.

From the literature reviews the widespread application of the Funds of Knowledge theoretical approach and empirical work, counters deficit views of subjugated families and elevates the strengths and resources within households. Initial findings from the range of studies on family and student's everyday experiences at home showed language and literacy practices related to doing farming and animal management, construction and building, figuring out finances, attending to medicine and spiritual wellbeing, among other practices. Identification of these practices prompted a number of literacy and teaching curricular projects across grades in schools. Notably, these initial studies of identifying practices in family households involved teachers and researchers working collaboratively. They examined, prepared, conducted, reflected, analyzed, and reimagined together the ways practices at home can become resources for teaching and learning. As noted by Rodríguez (2013) in her literature review, "rather than allow the assumption of 'cultural deficits' to persist in the educational arena, the initiating researchers emphasize the presence of knowledge, skills, and strategies among students that were produced in settings beyond the school – and therefore, beyond the immediate view (and appreciation) of their teachers" (p. 90).

More recent research on Funds of Knowledge argues that it is also necessary to "acknowledge and understand, rather than avoid, the dark funds of knowledge, the consequences for students of living in difficult circumstances" (Moll, 2019, p. 135) that are also present in households. Thus, the positive benefits of strengthening relationships using the Funds of Knowledge approach among students, peers, families, and teachers ought to also consider the dangers of presenting a single story (Adichie, 2009). As stated in their literature review (2021), "[u]nlike many other education approaches, funds of knowledge curricula cannot be adopted as easily in other settings once developed." (Denton and Borrego, 2021, p. 85). This caution is also succinctly noted by González

(2016) who asked, “[h]ow do we account for diversity without falling into essentializing discourses about students, communities, and families?” (p. 73). Keeping the importance of local and contextual factors in mind, many studies in a variety of subject areas and grades provide examples of ways Funds of Knowledge can better engage students’ home languages, cultures, and experiences in school subject area learning.

Research on funds of knowledge in subject area learning

Scholars have documented ways in which teachers embrace Funds of Knowledge as an assets-based approach. They show how students and their families become active participants of curricula taught in ways that are culturally and/or linguistically relevant for students (Borgerding, 2016; Coles-Ritchie et al., 2015; Cribbs and Linder, 2013; Tan and Calabrese Barton, 2010; Walkington, 2017). With the premise that Funds of Knowledge activates language and literacy engagement and learning, some studies have explored traditional subject area topics such as natural science with a broader inclusion of scientific thinking from non-Western points of view. One such project was the Mien-American garden cultivated with Mien families in Sacramento, California (Hammond, 2001). In another gardening project, math and science lessons were integrated. This plan called for students to calculate mathematical values such as the distance between plants, daily volume of water for plants to thrive, and the perimeter of the gardening project (Diaz and Bussert-Webb, 2017). When such gardening projects are coupled with the concept of food deserts, critical engagement with science, math, and nutrition can lead to personal and/or collective action in a specific community. In the Hammond study, findings also revealed that “a new kind of multi-science can emerge, one accessible to all collaborating members and responsive to school standards” (2001, p. 983).

Elementary classroom teachers have also explored the Funds of Knowledge theory as a means to improve their pedagogy and praxis. For example, Amanti (2005), an elementary teacher and master’s student, documented her role as a teacher-researcher while she engaged in a Funds of Knowledge project with families who had horses. Amanti visited students’ homes to learn about the students’ and families’ experiences with horses at their Arizona residence or in Mexico. During her observations, she learned about the different types of feed for the horses and how to care for them. She even learned about racing horses. When Amanti identified the vast amount of Funds of Knowledge her students’ and their families had about horses, she developed a curricular unit about horses that extended students’ learning new knowledge about social studies (e.g. history), language arts (e.g. vocabulary, stories), math (e.g. measurements), and science (e.g. anatomy of a horse). Amanti observed the impact the Funds of Knowledge project had on her pedagogy and her classroom community. She noted that her teaching shifted from a teacher-directed to student-centered pedagogical approach. She accomplished this change by inviting students’ and families’ voices (parents as expert guest speakers), skills, and lived experiences into her curricular plan.

Middle school teachers have also embraced and incorporated Funds of Knowledge as an approach that aides in the scaffolding of content areas, such as science. For example, Tan and Calabrese Barton (2010) examined the pedagogical strategies of Mr. M., a white, male, sixth grade science teacher at a middle school. The teacher created formal spaces that created opportunities for his minoritized students of color to make connections with their Funds of Knowledge and the science content, specifically a unit on nutrition. During the enactment of lessons, students worked collaboratively to make nutritious food and to provide information about the nutritious benefits of a meal, beverage, or snack they provided to their peers and guests. During the unit students were invited to share their stories from kitchens at home and experiences in markets to make relevant connections with scientific vocabulary and principles. Also, parents were invited on field trips. With Mr. M.’s interest in raising the authority of familiar Funds of Knowledge in his science curriculum the disciplinary vocabulary, principles, and locations of scientific knowledge were normalized for all. Contrary to some deficit thinking about parents of minoritized students and their families, the parents in this study took up the invitation to engage in learning with their child’s teacher and peers.

High school teachers have also drawn on students’, parents’, and communal Funds of Knowledge as a method for improving their praxis in content areas. For example, Borgerding (2016) examines how a teacher explored with his predominantly white students in a rural high school the concept of evolution in their biology class. Findings show how this male teacher from the community and his students had largely positive evolution learning experiences even as some students came from homes that reject evolution on religious grounds. The teacher strategically positioned himself as not personally representing science. Instead, he consistently took the position “according to scientists (pg. 72).” Such instruction honored local funds of knowledge with respect to local knowledge of nature and by treating students’ religious knowledge as a form of local expertise. Additionally, the teacher served as a border crossing “tour guide” by helping students identify how the culture of science and the culture of their lifeworld differed with respect to evolutionary theory. Students negotiated the cultural borders for learning evolution and respected the teacher’s sensitivity toward multiple positions. In this way students examined diverse ways of critically thinking about the discourse and premises of science.

Environmental education and wildlife conservation has also been the context for Funds of Knowledge research. An example is Arreguín-Anderson and Kennedy (2013) study which documented how Latinx culture and the Spanish language was intentionally used to teach the characteristics of animals and plants of the various regions in Texas. Capitalizing on the ways of knowing generated in students’ homes, teachers are encouraged to use visuals, songs, physical activities, and home remedies for lesson planning and for identifying common cognates between English and Spanish. These cognates may include *predador* (predator), *población* (population), and *ecosistema* (ecosystem). Adopting the view of language as a resource for learning (Ruíz, 1984), the Next Generation Science Standards advocate for making science real and relevant to the lives and future careers of all students (Lee et al., 2014)

by specifically capitalizing on their Funds of Knowledge (Lee et al., 2019). This particular study set out to accomplish these goals in a professional development workshop for teachers conducted in Spanish.

A Funds of Knowledge approach is also important in social studies education where issues such as immigration and citizenship are vital to teach and critical for students to understand. Zipin (2009) argued that students and their families do not always have positive, or “light” Funds of Knowledge for development in school curricula. Rather, he argues students may have “dark” experiences of violence, racism, poverty and abuse. The question is, will teachers stick to the academic work that neatly aligns with positive family practices and avoid the emotional work involved in transforming “dark” Funds of Knowledge? Social studies experts acknowledge the importance of building on comfortable and uncomfortable experiences in students’ lives. Naming these experiences is the issue at hand. Because “dark” historically has been used in racist discourses about Black and Brown people and their bodies (Dumas, 2016), researchers such as Becker (2014) proposed the concept of Funds of (difficult) Knowledge to account for difficult experiences such as violence in family migration stories. Rodríguez and Salinas (2019) used testimonios of Latinx teachers and students that recounted traumatic experiences such as deportation to describe how “dark” funds are complex and difficult Funds of Knowledge.

For Gallo and Link (2015) the issue of documentation, undocumented status, and belonging in mixed status families with the accompanying personal and collective fear of deportation is less about “dark” or difficult, and more about the agentic possibilities, or “literacy for action” (González and Moll, 2002, p. 637), offered by consciously embracing Politicized Funds of Knowledge. In their work Gallo and Link (2015) state Politicized Funds of Knowledge are “the experiences, knowledges, and skills young people deploy and develop across learning contexts” (p. 357). These are the types of experiences with potential for classroom communities to understand the root causes of oppression. In the United States the social studies is one of the subject areas that can provide liberation to minds, hearts, and spirits rather than ignore or discount injustices in families and communities, past and/or present. In other countries various Funds of Knowledge approaches are also important.

Funds of knowledge in international contexts

A plethora of international contexts are taken up by scholars interested in the Funds of Knowledge approach in their educational research. Examples are scholars who have conducted studies in New Zealand (Cooper and Hedges, 2014; Hedges et al., 2011), Australia (Mantei and Kervin, 2014; Zipin, 2013; Zipin et al., 2012), the United Kingdom (Cremin et al., 2012; Hughes and Pollard, 2006), Spain (Jovés et al., 2015; Saubich and Esteban, 2011); (Vila and Siqués, 2013), and Uganda (Kendrick and Kakuru, 2012). These research studies involve educators from early childhood settings to child-run homes. Although each country has its own unique context, there are many overlapping similarities, such as the changing demographics of student populations due to poverty, mobility, health, and safety concerns.

Moll (2019) specifically documented how Funds of Knowledge have been applied in countries such as New Zealand, Australia, Spain, and Uganda to meet the needs of their dynamically changing sociocultural context. Noted by Moll (2019) is a New Zealand study (Hedges and Jones, 2012) where young children’s working theories are mediating products of their own agency and of their relationships with peers and siblings. As a receiving community of many immigrant families, Catalunya, Spain, has felt the impact of diverse newcomers in its schools. Rather than emphasizing ethnographic perspectives, the research approach of Saubich and Esteban (2011) is highlighted by Moll (2019) because the researchers relied on administering tasks to family members, such as self-portraits, assessment of family artifacts, taking photos of family routines, etc. Rather than the traditional ethnographic approach of Funds of Knowledge, this study also concentrated on the formation of identity and how families come to understand themselves.

In Australia, Zipin et al. (2012) are cited by Moll (2019) as applying the Funds of Knowledge framework in communities that are “undergoing complex unsettlements” rather than more cohesive or settled communities. Central to this work are students becoming researchers of their own lives no matter how dark their past or present circumstances may be. Moll (2019) also noted how the health epidemic of HIV/AIDS that ravaged regions such as Uganda left orphaned children generating Funds of Knowledge for survival and protection. As such, children living in child-headed families were observed using language practices such as stories, songs, riddles, proverbs, and translanguaging between Uganda and English as resources for further education and survival (Kendrick and Kakuru, 2012). With a broader understanding of ways that the Funds of Knowledge theory can have lasting effects on the identities of learners the Funds of Identity offers a new theoretical construct.

Defining a funds of identity approach

Until recently emphasis on family Funds of Knowledge did not address the individual Funds of Identity (Esteban-Guitart, 2016; Esteban-Guitart and Moll, 2014a) from daily lived interests, experiences with peers, membership in communities, and participation in popular culture. Esteban-Guitart (2014) notes, “Funds of knowledge...become funds of identity when the participants appropriate them and use them to define themselves” (p. 753). Accordingly, he defines the term Funds of Identity, as representing an accumulated set of historically and culturally developed tools essential for constructing one’s identity and defining individuality (Esteban-Guitart, 2016). As a theoretical construct, Funds of Identity refers to artifacts (written, spoken, visual, musical, or combinations in multimodal form) that people absorb and create from their social worlds and their household’s Funds of Knowledge to actively define themselves in and across social environments. With this approach researchers observe how children create their own Funds of Identity from being with peers, problem-solving with them, and experiencing diverse social contexts with adults and other

children like and unlike them. The challenge as pointed out by Esteban-Guitart and Moll (2014), is “to recognize and maintain optimal identities for learning (Coll and Falsafi, 2010)” (p. 44).

Originally, Esteban-Guitart (2012) identified five types of Funds of Identity: “Geographical Funds of Identity” can include an area, landscape, river, mountain, city, country, etc. (Jovés et al., 2015; Saubich and Esteban, 2011); “Practical Funds of Identity” include important activities for the individual such as work, music, hobby, sport, etc. (Marsh and Zhulamanova, 2017; Moulton, 2018); “Cultural Funds of Identity” includes artifacts, flags, religious symbols, etc. (Nagle and Stooke, 2016; Poole, 2017); “Social Funds of Identity” refers to significant people, friends, etc. (Nagle and Stooke, 2016; Saubich and Esteban, 2011), and “Institutional Funds of Identity” refers to social institutions family, marriage, church affiliation, etc. (Charteris et al., 2018; Marsh and Zhulamanova, 2017). Since then, additional contributions to the Funds of Identity approach have emerged in the literature: “Digital Funds of Identity” such as creating a blog, avatar, videos, music, artwork, etc. (González-Patiño and Esteban-Guitart, 2015; Poole, 2017); “Popular Culture Funds of Identity” refers to music, shows, comics, toys, dance styles, etc. (Nagle and Stooke, 2016; Ordoñez et al., 2018); and Poole (2017) identified “Existential Funds of Identity” as negative experiences and emotions (Poole and Huang, 2018) and “Ideological Funds of Identity” as “political, cultural or religious beliefs” (Poole, 2017, p. 8), as sub-divisions of Cultural Funds of Identity.

One systemic literature review examined 24 studies and encompassed conceptual and empirical studies within the United States and internationally (Hogg and Volman, 2020). This literature review found that researchers utilized two methods for participants to identify their Funds of Identity. One method focused on the creation of a narrative or an object and the other method focused on gathering objects. The following are examples of the methods used to identify Funds of Identity: self-portrait and an explanation of the portrait (Saubich and Esteban, 2011), significant circle (Moulton, 2018), poems (Subero, 2015), diary entries (Esteban-Guitart, 2012), taking photographs (Marsh and Zhulamanova, 2017), videos (Esteban-Guitart and Moll, 2014b), maps (Moulton, 2018), collages (Subero et al., 2018), “self-portrait, multilingual texts, shoeboxes used to bring into school meaningful objects from home” (Subero et al., 2017, p. 253), discussions (Esteban-Guitart et al., 2019), guided reflection activities (Charteris et al., 2018; Recchia and McDevitt, 2018), and developing digital literacy media (Nagle and Stooke, 2016; Poole and Huang, 2018). Overall, the reviewers (Hogg and Volman, 2020) found that the studies documented effective strategies for teachers to learn about students’ Funds of Identity. They suggested that future research ought to examine how the theory supports the academic development (outcomes) of students when examining their Funds of Identity.

Research on funds of identity in subject area learning

Some scholars have utilized Funds of Identity as the theoretical framework to examine subject area learning (Esteban-Guitart et al., 2019; Hachey et al., 2021; Nagle and Stooke, 2016; Poole, 2017). For example, Hachey et al. (2021) worked with a kindergarten teacher to develop “making-based curriculum” that drew on Makerspace Pedagogy to examine students’ STEM academic identity. The team selected a picture book, *Creepy Carrots* (Reynolds, 2014), that they identified as drawing on “potential funds of knowledge” of the rural students. The book is about a bunny who eats too many carrots and later imagines they are following him. To contain the carrots in the garden, the bunny builds a wall around the garden and a moat with alligators to keep the carrots contained. After hearing the story, students were asked to take on the role of the rabbit and problem solve with their own solutions. The researchers found that there were differences in the varied gendered groups (girls, boys, and a heterogeneous groups). The all boys and all girls groups’ artifacts “show(ed) more stereotypical characteristics associated with their respective gender” (Hachey et al., 2021, p. 476). The authors highlight the lack of STEM education within the early grades and the importance of incorporating hands-on learning to develop funds of identity in the STEM areas.

Within middle school contexts, scholars have explored students’ Funds of Identity (Moulton, 2018; Nagle and Stooke, 2016). In the research study by Nagle and Stooke (2016) four-seventh and eighth grade students’ created history projects in digital forms over a two-week period. The history projects were based on students’ personal interests in Canada. Two participants created a slideshow of the “...development of an intercolonial railway in the mid-1800s...” and the two other participants developed a website that highlighted opposing British and American views (Nagle and Stooke, p. 160). Through the history project, students drew on their Funds of Identity: Practical Funds of Identity (music and video games); Cultural Funds of Identity (Irish and Scottish family background); Social Funds of Identity (student-teacher relationship and student-to-student friendships); Popular Funds of Identity (Che Guevara and Rage Against The Machine); and Digital Funds of Identity (website, slideshow, and videos). Researchers question the role that teachers need to play in supporting their students in developing multimodal texts (website and slideshow) and the importance of creating more opportunities for them to draw on their Digital Funds of Identity. Findings highlight the importance of providing students with sufficient time and space to socialize while working on creating their multimodal texts.

Scholars have also examined students’ Funds of Identity within high school contexts (Poole, 2017, 2021; Poole and Huang, 2018). For example, Poole (2017), as a researcher-participant, examined 31 10th grade Han Chinese high school students’ Funds of Identity through a two-week English unit. The unit explored identity, The Avatar Project, at an internationalized high school located in Shanghai, China. Student constructed word clouds, avatars, and written reflections were analyzed for Funds of Identity. Poole found that Chinese students revealed several types of Funds of Identity: Geographical Funds of Identity (China, Shanghai, and students’ towns of origin); Social Funds of Identity (parents, grandparents, teenager, cousins, teachers, friends, and pop stars); Institutional Funds of Identity (family and school); Practical Funds of Identity (digital, software, applications, computer games, music, and sport); Cultural Funds of Identity (local dialects, Filial piety, panda, and Chinese flag); Ideological Funds of Identity (patriotism, desire to study abroad and give back to the country, and Christianity); and Existential Funds of Identity (low-self-esteem,

identity issues, peer pressure, and death). Poole noted the importance of complementing digital strategies, such as creating word clouds and avatars, with written reflections to better analyze and interpret students' Funds of Identity. He also cautioned that time and experience with multiple software can impact the avatar students create. The key is to avoid circumstances in which students settle for an avatar that is not representative of their Funds of Identity. Another key finding is the role of the teacher in facilitating a project such as the one Poole completed with his students. He warns that the role of teacher can shift to spectator rather than facilitator, which may be out of the ordinary for some teachers. In addition, through the project, he learned about the "...psychological and affective aspects of (some of his students') development..." (Poole, 2017, p. 16). As a reflective practitioner he questioned what to do in his role as a teacher with this new knowledge. As the 21st century continues to unfold, ways for teachers to uncover and become responsive to new knowledge through the theoretical lenses of Funds of Knowledge and Funds of Identity is necessary.

Funds of knowledge and funds of identity as theoretical lenses

Several researchers have examined empirical work through the use of Funds of Knowledge and Funds of Identity as a combined theoretical framework (Charteris et al., 2018; Jovés et al., 2015; Recchia and McDevitt, 2018). For example, Jovés et al. (2015) examined research that emerged from a study group comprised of eight in-service teachers and university professors in Spain. The professors supported the teachers in learning how to examine the Funds of Knowledge and Funds of Identity of one student within each of the teacher's classrooms. In their article, Jovés and colleagues examine a second-grade teacher's experience in integrating both approaches with a Moroccan family.

During the teacher's home visits, she interviewed the parents and examined the funds of identity of her student by asking him to create an identity drawing and a significant circle. The Funds of Knowledge data revealed the family's knowledge about agriculture (caring for animals on the farm), religion (Koran), languages (Berber, Arabic, and Spanish), home repairs (household appliances), and cooking (bread, biscuits, Moroccan, and Mediterranean food). The focal student's Funds of Identity consisted of: Geographical Funds of Identity (Nador, Morocco and Catalonia, Spain), Social Funds of Identity (family, friends, relatives, and neighbors), Cultural Funds of Identity (Arabic, Berber, Catalan, and Spanish languages), Institutional Funds of Identity (school, family, and the Mosque), and Practical Funds of Identity (cycling and going to the farm with his dad, learning Spanish at school and Arabic at the Mosque, and making cookies with his mother). Through data analysis, the teacher identified and developed a unit on farm animals since the topic emerged in the interviews (Funds of Knowledge) and the student's artifacts (Funds of Identity).

The farm animal unit covered an array of content areas: science (types of animals, characteristics of animals, and classification of animals), math (measurement of ingredients used in a recipe), language arts (summarizing their farm field trip experience), creating a multimodal text (poster) that incorporated pictures taken during the field trip to the farm, reading texts, searching online for animal riddles, writing a biscuit recipe, and translating the recipe through the support of their family, and art (creation of a mural) as a culminating event, a visual summary of the unit). The authors, Jovés et al. (2015), note the vital role that the parents' Funds of Knowledge and the focal student's Funds of Identity played in fostering and enhancing the educational farm unit the teacher developed.

Involving students in the process of designing classroom activities based on their own interests and Funds of Knowledge (González et al., 1995) has been observed as affecting their identity investment in classroom practices (Norton, 1995). In the United Kingdom, Andrews and Yee (2006) studied two Muslim primary school-aged children engaged in out-of-school learning. Although they engaged in many similar activities at home and in their communities, the significance of each child's investment in the activities was different. In New Zealand children's Funds of Knowledge were observed as working theories based on interests and inquiries with peers and siblings during play activities (Hedges et al., 2011; Hedges and Jones, 2012). These studies show that positive identities as learners can emerge and grow in out-of-school settings, and in children's play. As such, children's Funds of Knowledge and interests play an important role in their developing Funds of Identity. However, Funds of Identity are conceptualized beyond play or children's interests on "activities that are geographical (spaces), social (people), cultural (artifacts) or institutional (locations) and that each of us incorporate into the vision we have of ourselves and of what, for each of us, is significant and important" (Llopert and Esteban-Guitart, 2018, pp. 155–156). More specifically, Funds of Identity are understood to comprise of significant people such as grandparents, spaces such as a lake, institutions such as the Muslim religion, or artifacts such as a musical instrument – all that best defines the unique emerging self in each student.

Esteban-Guitart et al. (2019) also explored Funds of Knowledge and Funds of Identity in two different school contexts in Catalonia, Spain. The two participatory action research projects involved at least 30% students of foreign origin assisting state-run schools and within the boundaries of the city of Barcelona. In one context, Funds of Knowledge were examined with a group of seven teachers interested in implementing the approach to improve the curriculum. After learning about the approach, the teachers explored students' Funds of Knowledge by carrying out five home visits with the families they identified. Interviews were developed collectively and meaningful circles plus artist's books acknowledged as important for gathering comprehensive information on families and students. After the interviews, one significant learning of the Funds of Knowledge approach was the importance of peanuts in the kitchens of several families so they worked collaboratively to implementing a peanut activity with their five- and six-year-old students. As a result, the natural sciences were explored using various languages (Spanish, French, Chinese, etc.) present in the children's families. Another significant finding, from the Funds of Identity approach with students, was creating space for direct dialog about racism and providing opportunities for writing and acting out through theater, the labels imposed on children by others in their social world. The study recommends that sustainability in an increasingly multiracial, multilingual, and

multicultural world goes beyond culturally sustaining pedagogy to uncover and uphold the meaningful practices that guarantee the survival of different experiences, practices, and life contexts. This means “going beyond the typical assimilationist values and practices prevalent in schools, in which the curriculum, instruction and teaching practices are often disconnected from the meaningful experiences, life contexts and practices of learners” (Esteban-Guitart et al., 2019, p. 9). The two projects in Barcelona illustrate strategies that are sensitive to the resources of families as well as children’s own areas of sense making. The researchers offer a provocative thought for amplifying culturally sustaining pedagogies, “we believe that a pedagogy of cultural and identity sustainability should normalize diversity (incorporating it into school practice), as well as diversify normality” (Esteban-Guitart et al., 2019, p. 10).

Like Hidden Funds of Knowledge (Martínez-Roldán and Fránquiz, 2009; Moll, 2015) from home and community that are unseen, ignored and neglected in schools the Invisible Funds of Identity that develop tacitly in learners are also critical to address. Accordingly, the purpose of education from an Invisible Funds of Identity framework is “[T]o make explicit the impact of negative hegemonic-dominant discourse and practices such as racism, discrimination, or colonialism” (Esteban-Guitart, 2021, p. 12). These dominant discourses are “produced and distributed historically, culturally and socially and end up tacitly embedded in people’s behaviors, thoughts, and practices even though they may be unaware of them” (Esteban-Guitart, 2021, p. 12). Such a perspective requires teachers to build curricula for students that uncovers not only the Hidden Funds of Knowledge from outside of school contexts but also requires the dismantling of the dominant discourses and practices that undergird the identities and identity productions of students. The theory of Funds of Identity, then, works within the framework of the Funds of Knowledge with the goal of enacting social justice pedagogies and humanizing pedagogies (Fránquiz and Salazar, 2004; Salazar, 2013) in classrooms. The goal is to uncover deficit thinking in/from people, institutional structures and legacies of colonization. In super diverse classroom activities, these Invisible Funds of Identity can present themselves in and through the creation of identity artifacts such as drawings, photos, avatars, or literacy journey boxes (Fránquiz et al., 2011).

Conclusion

As active participants and agents in familial, school, community, and digital contexts children acquire a variety of linguistic and cultural practices that build on and build up their Funds of Knowledge and Funds of Identity. Esteban-Guitart (2021) explains that “It is important to emphasize here that *all* funds of identity are funds of knowledge, but not all funds of knowledge are funds of identity” (pg. 4, emphasis in original). While the former emphasizes cultural and intellectual resources that households use for their welfare, the latter emphasizes significant people, cultural artifacts, spaces, passions, and interests within a learner’s definition of self. The strategy for building on students’ Funds of Knowledge requires home visits and partnerships with caregivers, their practices, and their extended network for health and well-being. The strategy for building up Funds of Identity requires opportunities to create and share identity artifacts in school and after school contexts. The cautionary considerations for appropriating Funds of Knowledge and Funds of Identity for humanizing pedagogical purposes is not just to validate funds, but to include them meaningfully in identifying social problems, reflecting individually and collectively about necessary changes, and taking actions toward transformation. Actions may be identity products representing the self, such as creating posters, speeches, murals, petitions, podcasts, internet posts, etc.

As the Funds of Identity framework develops, there has been limited research on ways to respond to the urgent need for the preparation and sustainability of career educators who are capable of and committed to advancing system-wide equity and access for students from culturally, economically, and linguistically diverse backgrounds. More work is needed to understand how gender and status would affect experiences that influence the development of Funds of Identity and how it is affirmatively cultivated. Noteworthy would be the influence of male teachers of color on students in spaces such as elementary education or women in STEM fields and their influence in historically male dominated learning spaces. The influence of indigenous world views on the Funds of Knowledge and the Funds of Identity in schools for indigenous children or in schools for all learners would impact the degree of educational development afforded to future generations.

Implications for future research and educator preparation

Given the feminization of the teaching profession and the scarcity of male teachers, how might a Funds of Knowledge and Funds of Identity research approach benefit families and their children? Recent studies on teachers of color take into account the hyperawareness and differential intersecting identities of male teachers (e.g., Lynn, 2006; Bristol and Goings, 2019; Brown, 2012). In the case of Latinx male teachers, they share common characteristics with the public narrative of whitemale (Grande, 2003; Urrieta, 2009) male teachers, yet these men live in a parallel world with intersecting identities that do not necessarily obtain the benefits of hegemonic masculinity and male privilege (Lara and Fránquiz, 2015). While intersectionality is prevalent in education research for its capacity to illuminate how identities like race, gender, ability, and class interact and shape individual experiences (Sibbett, 2020), a Funds of Knowledge and Funds of Identity framework may provide a complimentary way for understanding the assets that the underrepresented population of male teachers generally and male teacher of color in particular bring to the profession. Such understanding may reveal how pre- and post-professional development for male teachers ought to be reimagined and what matters in the sustainability of their Funds of Identity.

Future research should examine: To what degree does ancestral knowledge and family history matter in educator preparation?, To what degree does teacher’s intersectional story matter? and Does providing teachers opportunities to reveal their Funds of

Knowledge and Funds of Identity through identity artifacts influence their persistence in the teaching profession? Researchers are encouraged to conduct studies about ways to validate and tap the rich expertise that all teachers generally and male teachers particularly bring to K-12 classroom and out of school educational settings.

As teacher education programs take up the call for preparing aspirantes/future teachers for highly diverse classrooms, intentional attention must be drawn to their Funds of Knowledge (González et al., 2005; Moll et al., 1992) and their developing Funds of Identity (Esteban-Guitart, 2016; Esteban-Guitart and Moll, 2014a). Providing safe spaces to unpack racial experiences for preservice teachers are necessary. Because the profession is still predominantly white and female (Kohli, 2019; National Center for Education Statistics, 2018; Sleeter, 2017), one way to experience anti-racist education is by providing environments where students will not be minoritized, such as affinity groups (Bell, 2015). Racial affinity groups are self-selected groups made up of people who identify with similar racial or ethnic backgrounds. Race affinity groups can create an environment where preservice teachers interpret, critically reflect, find fellowship, identify personal biases, and become more aware of cultural responsiveness (Douglas, 2008). Affinity groups as a tool for providing a safe space where all preservice teachers can share and unpack their racialized and gendered experiences holds great promise for the better preparation of teachers for an increasingly diverse student population.

Introduction and background

In this chapter, we critically examine the literature in the area of family literacies. We begin by tracing the popularization of the term in the 1980s. Next, we briefly describe theoretical frames that inform the field of family literacies and our interpretation of the research literature. As the concept of family literacy gained prominence, its meaning became bifurcated in that, for some people, it meant the day-to-day literacy activities and events families engage in at home and in the community while, for others, it connoted intervention programs (Anderson et al., 2010; Hannon, 2003). We first review “naturalistic” studies of family literacy and, recognizing that digital technology is a facet of daily life for many families (e.g., Marsh et al., 2017a), we address how families take up digital literacy. Acknowledging that there are ongoing issues associated with family literacy programs, we next examine how program developers and facilitators have addressed these issues (or not). We conclude by discussing the implications of research in this area, identifying what we believe are gaps or limitations, and speculate about the future of family literacy scholarship and programming.

Denny Taylor popularized the term, “family literacy” with the publication of her acclaimed 1983 book, *Family literacy: Young children learning to read and write*. That ethnographic study documented how pre-school children growing up in middle class homes in the United States (US) were acculturated into literacy as their parents and other family members engaged in various literacy activities and events as part of daily life. In a later study with inner-city families in the US, Taylor and Dorsey-Gaines (1988) showed how parents and other family members of young children living in severe poverty, and in challenging and sometimes dangerous conditions, supported their children's literacy development and learning at home.

Although Dolores Durkin (1966) in the United States and Margaret Clark (1976) in the United Kingdom had done studies with young, precocious readers who had learned to read at home prior to formal instruction in school or preschool, Taylor's work precipitated a great deal of interest in family literacy. As Panofsky (2000) pointed out, at this time there was a burgeoning interest in children's early literacy development (e.g., Clay, 1966, 1975; Ferreiro and Teberosky, 1982; Ninio, 1983; Teale and Sulzby, 1986), and several academics (e.g., Baghban, 1984; Bissex, 1980) documented their own children's emerging literacy. Thus, Taylor's focus on young children fits with the emergent literacy paradigm that was prominent in that era. A perusal of the literature on family literacy suggests that this emphasis on young children has been pervasive and persists today.

Theoretical frames

As Lynch and Prins (2021) indicate, scholarship in family literacy and family literacy programs draw on socio-cultural theory (e.g., Vygotsky, 1978) and the tenet that learning is initially social, before it is individualized. That is, guided by parents and significant others in their family and community, children/learners use “tools” such as literacy inter-psychologically. Wood et al. (1976) refer to the mediation by a more experienced or proficient person as “scaffolding” that is gradually withdrawn as learners use the tools

intra-psychologically, or independently. However, “human development is a cultural process” (Rogoff, 2003, p. 4) and different cultural groups support development and learning differently.

Consonant with Rogoff’s perspective is the concept of literacy as social or cultural practice (Heath, 1983; Street, 1995). That is, the meanings ascribed to literacy, its functions and uses, its importance and significance, and how it is learned and taught vary from one cultural and social context to another (Clay, 1993). For example, Heath’s (1983) groundbreaking ethnography in three economically and socially diverse communities in the Southeastern United States exemplifies how families’ literacy practices reflect this phenomenon. She found that while literacy in school aligned with literacy practices in the homes of the mainstream Townspeople, they did not align with those in the white working class community of Roadville nor the working class African-American community of Trackton and the children in the latter two communities were not well served by school.

Although much of the research in family literacy focuses on print, researchers and practitioners are increasingly drawing on “multiliteracies”, a concept “... based on the assumption that individuals ‘read’ the world and make sense of information by means other than traditional reading and writing” (International Bureau of Education, 2021, n.p). Relatedly, Kress (2010), and others employ the term multimodality in referring to the understanding that meaning is constructed and communicated through a number of modes, often simultaneously in the contemporary digital and technological world. We reference both concepts in this chapter.

Naturalistic studies of family literacies

Cultural and social diversity

Research documenting families’ literacies in homes and communities have continued apace in the nearly half-century since Taylor’s study. In this section, we briefly canvas studies from culturally and socially diverse contexts and examine differences in the mediational roles that significant others play.

In an influential study, Purcell-Gates (1996) documented the literacy practices in twenty low-income, urban homes in the United States. She found that families engaged with a range of texts on a daily basis and that there was a relationship between the types of texts read at home and children’s emergent knowledge of print. Essentially, children from homes where longer texts (e.g., newspapers, magazines) were read developed more emergent knowledge of print than children where shorter texts (e.g., coupons, TV Guide) were read. There was considerable variation in the amount and frequency of reading among this relatively homogeneous socio-cultural group with some families engaging in a lot of reading and writing while other families did little. Indeed, “Some families in this study, in fact, lived busy and satisfying lives with very little mediation of print” (Purcell-Gates, 1996, p. 425).

Family literacy is often synonymous with shared book reading, notwithstanding the fact that adults sharing books with children is a practice particular to some cultural groups, and is far from universal (Anderson et al., 2003; Reese, 2012). For example, reflecting on literacy practices in her family growing up on a Navaho reservation in Northern Arizona, Marlinda White-Kaulaity (2007, p. 560) recalled, “‘Read me a story’ are words I never said. ‘I’ll read you a story’ are words I never heard.” Instead, she explained, storytelling was a widely used tool in her community for learning and teaching. Indeed, reading and writing were considered of little immediate benefit, and not highly regarded. Furthermore, reading and writing have been used as colonialist tools within Indigenous communities to disempower and discredit people, and thus are viewed with suspicion (White-Kaulaity, 2007).

Other studies demonstrate the multiple ways in which some families interact with texts in different modes, switching between different languages. Sibanda and Kajee (2019) examined the multi-lingual, multimodal language and literacy practices in the homes of 3, 8 and 9-year-old children who attended a primary school in a township in Gauteng province, South Africa. Thandi, a Zulu speaker who participated in the study, liked English language television programs. She especially liked drawing and wanted to become a fashion designer. She borrowed her uncle’s mobile phone to play games. As well, she regularly read books that the school provided. Setswana, an official language of South Africa, was the medium of instruction at school, and Thandi’s facility with different languages indicates she is multilingual. Another participant, Lindi, moved from KwaZulu-Natal, after her parents died, to live with her maternal grandmother and other relatives who spoke isiXhosa. She read the Bible at church services and assisted adults there who were unable to read. Lindi consistently reminded her grandmother to complete and submit the forms necessary for government support for orphaned children such as herself and her siblings. Tumelo’s (the third child in the study) first or home language, Setswana, was the language of instruction at school. She engaged in shared reading of school texts with her mother, and was also expected to read them on her own. Interestingly, Tumelo’s mother indicated that she also learned by helping Tumelo with homework. In these homes, family literacy may include, but extends beyond shared book reading.

Similarly, an ethnographic study with three kindergarteners in Puerto Rico conducted by Volk and de Acosta (2003) exemplifies the diverse ways that families from different socio-cultural contexts engage in literacies. They analyzed what Volk and de Acosta called “syncretic” at-home literacy practices whereby the “participants drew on oral and written texts from various contexts in their lives and reinvented them. The new practices they created were more than a juxtaposition of old ones, but rather were recreations that provided new opportunities for learning” (p. 22). They drew on texts from school, from church, from the community and popular culture. Although Spanish was the home and dominant language of the children, they were also facile in English. As well, in addition to their parents, a network of significant others including siblings and other relatives supported the children’s learning.

As indicated previously, literacy is embedded in religious practices in some homes and, over the years, researchers have studied this phenomenon (e.g., Fishman, 1987; Lytra and Ilankuberan, 2020; Lytra et al., 2016). As part of the Becoming Literate in Faith

Settings (BeLiFs, 2021) project in London, UK, Souza et al. (2016) reported on an ethnographic study in which they gave children flip cameras to record religious practices at home and had them construct scrapbooks depicting these faith practices. Souza and colleagues indicated that the religious practices included oral and written texts, and facilitated an understanding of symbolism and metaphorical language, abilities that schools should encourage and help students develop.

These studies reflect the theoretical perspectives outlined earlier in several ways. For example, the differences within the relatively homogeneous group of families in the Purcell-Gates study exemplifies a literacy as social practices perspective. Likewise, the range of texts and modes for different functions and purposes that the children in Sibandi and Kajee's study engaged in, and their plurilingualism, are consistent with a multi-literacies or multi-modal frame. Furthermore, the mediational roles that adults and children perform across the studies align with socio-cultural theory.

Mediators of literacy

Family literacy is often considered intergenerational in that parents (or grandparents) play important roles in mediating learning. Intergenerational learning is a feature of many cultures around the world (Ouane, 2008) and much of the literature in family literacy focuses on parents supporting their children's learning. However, we next examine studies that have investigated the roles of siblings and significant others, besides parents (or grandparents), in supporting learning in family contexts.

Gregory (2005) observed and recorded the literacy activities that young children engaged in at home in East London, UK. The eight families, each with an older child who was 10 or 11 years old and a younger child aged 4–8, had emigrated from Bangladesh. The children were bilingual in English and Sylheti, a Bengali dialect. At home, the children regularly played school with the older child, emulating closely the literacy lessons from school, as they "taught" their younger sibling. The older children also shared academic or disciplinary knowledge learned at school, imparting the routines and practices from there. Gregory (2005, p. 37) illustrated, "the very special role played by siblings close in age as literacy mediators in initiating their younger siblings into the wider school discourses ... or ways of behaving, valuing, and expressing new opinions, beliefs, and views". The older children also benefited as they practiced and solidified their literacy skills and strategies in a familiar, low-risk environment (Gregory, 2001).

In their study of child headed households in Uganda, Kendrick and Namazzi (2017) also identified the inadequacy of conceptualizing family literacy as parent-child apprenticeships. They worked with four families where the heads of the household ranged in age from twelve to eighteen, and with other family members as young as three. Kendrick and Namazzi documented a number of practices across the families, including: using songs and drama to educate about HIV/AIDS, and to entertain, communicate information and knowledge, and share feelings; bringing home sports news garnered from the market and reporting them in the format of a radio program; and using family photographs to discuss family history. Importantly, their findings suggest the need to conceptualize the Zone of Proximal Development theorized by Vygotsky (1978) differently from the parent/significant other-child dyad model that is implicit in much of the literature. They stated, "These practices required that siblings commonly operate within a collective Zone of Proximal Development (ZPD) whereby no one member of the family necessarily has the expertise to teach or apprentice younger siblings" (Kendrick and Namazzi, 2017, p. 70).

Literacy brokering is practiced in many families, and in some cases, children act as literacy brokers for their parents or older family members (e.g., China and Robins, 1996; Orellana et al., 2003; Perry, 2014). According to Perry (2009), "Literacy brokering is a complex activity that may involve one aspect of a text, such as translation of word meanings, mediation of cultural content, or explanation of genre aspects of a printed text, or it may involve many of these aspects all at once" (p. 257). Utilizing ethnographic methods, Perry (2009) documented the literacy brokering practices in three Sudanese families with refugee status in the United States. She identified a number of individuals who were literacy brokers for the adults, including their children who were in kindergarten and grade one. Although literacy brokering is sometimes conceptualized as translating or paraphrasing (e.g., Orellana et al., 2003), Perry found that it went beyond these functions. She identified three types of literacy brokering: (1) lexico-syntactic and graphophonic where the broker explained the meaning of an unfamiliar word, or explained word order or word choice in writing a note, or demonstrated letter-sound relationship in identifying words; (2) culture brokering which entailed explaining customs or holidays or events; and (3) genre brokering, for example, explaining the purpose of grocery store coupons or hyperlinks on a website (Perry, 2009, p. 263). In her 2009 study, Perry recorded 257 literacy-brokering events, nearly half of which involved genre brokering. In a later study, she noted that children's brokering for their parents often relates to school such as forms, memos, newsletters and so forth (Perry, 2014).

The research on brokering as a family literacy practice such as Perry's and the others previously cited usually involved families' first languages and the dominant language/language of instruction in school in the resettlement country. However, in his study involving four Afghani families with refugee status living in Pakistan, the country of first asylum while waiting to immigrate to a country in which to permanently settle, Sadiq (2020) found that the children's brokering involved three languages-Pashto, their home language from Afghanistan, Urdu, the official language of Pakistan, and English. For example, they translated texts such as bills, wedding invitations, cards, and notices and notes from school written in English or Urdu to Pashto for their parents. Likewise, 11-year-old Safa (pseudonym) translated the Duas, Islamic texts written in Arabic, to Pashto for her father so that he could comprehend them.

In line with socio-cultural theory, these studies demonstrate the various, important and often culturally rooted role(s) of mediators in literacy learning. Thus although, it is implicit in much of the theoretical literature that adults are the primary mediators for children, these studies show that this is clearly not always the case.

Digital family literacy

As Marsh et al. (2017b) pointed out, there is a significant research base indicating that digital technology is now an integral aspect of family life for many people and thus it is essential to examine digital literacy in the context of homes and communities. In her seminal work, Marsh (2004) identified “techno-literacy” as significant in the home and defined the concept as literacy events and literacy practices mediated by digital technology. Marsh argued literacy skills were no longer limited to paper-based activities and that children and other family members accessed texts from multiple modes. She highlighted the “importance of visual, aural, and corporeal ways of meaning-making” (p. 52), not just print. She also outlined children’s emergent techno-literacy practices and the role(s) parents (and other significant adults) played in scaffolding children in learning to use technological devices such as computers and mobile phones. Marsh found that parents supported and encouraged young children’s techno-literacy practices and that these practices played a role in families’ relationships in the home. For example, the area around the TV was often set up for “celebrating and extending the children’s relationship with the screen” (p. 58), such as keeping dress-up clothes or toys nearby so children could easily access these props when re-enacting screen content. She also noted that children were not simply passive viewers but played with narratives and images viewed on the screen through re-imagined story lines and imitation of on-screen behavior. She found that men were more likely to collaborate with children in video game play whereas women were more likely to participate in print-literacy activities (e.g., read a storybook), a finding also observed by Connell et al. (2015) and Dias et al. (2016).

In the almost two decades since Marsh published her work, the field of young children’s digital tool use at home has increased exponentially. A number of large-scale surveys have examined young children’s access to digital technology in western countries. Common Sense Media (Rideout, 2013, 2017; Rideout and Robb, 2020) and the Pew Research Center (Anderson et al., 2020) have collected statistical information about Internet and digital access and use in the United States, and OFCOM (2016) and Eurostat (<https://ec.europa.eu/eurostat/web/main/home>) have collected similar data across Europe. These studies indicate the prevalence of digital tools in families across cultural and social groups, which in turn impacts engagement in digital literacy practices at home.

Home digital literacy environments

Although large-scale surveys provide important data about digital access and use, naturalistic studies have provided important insights into families’ digital literacy practices in homes and communities. Differences in how much or how little digital technology is used in homes has often been described on a spectrum of low use to high use (e.g., Chaudron et al., 2018; Plowman et al., 2012; O’Hara, 2011). For example, Wong (2015) categorized families as new dispositions (allowed a range of technology in the home and were enthusiastic about use); new and old dispositions (held mixed values toward traditional literacies and new technology); and traditional dispositions (few digital tools in home and were guarded about digital technology, thereby limiting children’s uses). It has been widely reported in research that many parents feel technology contributes to children’s learning and development and that technology is required for life in today’s society (Aubrey and Dahl, 2014; Dias et al., 2016; Kumpulainen et al., 2020; Kervin et al., 2018; O’Hara, 2011; Ozturk and Ohi, 2019; Schlembach and Johnson, 2014). Kervin et al. (2018), for example, quoted an Australian parent of a preschooler stating, “they [children] should have the basics of how to operate [the technology] ... *I don’t want him left behind*” (p. 120) (emphasis added). However, while parents have reported wanting their children to develop digital technology skills, they also seek to limit screen time (Gillen et al., 2018; Kervin et al., 2018; O’Hara, 2011; Teichert, 2017). Livingstone and Blum-Ross (2020) reported on parents who tracked the amount of time a child used a screen instead of focusing on quality of screen time interaction. They posited that screen time seemed “to offer parents an officially-sanctioned and seemingly straightforward metric of parenting ‘success’” (p. 33). It is important to note that parents’ positions on digital technology are often fluid. Parents in the same family may at times differ in their values and beliefs and negotiate with each other on what the best approach may be for their children (Livingstone and Blum-Ross, 2020; Roach O’Keefe and O’Keefe, 2020). For example, Livingstone and Blum-Ross (2020) demonstrated this tension when describing participants Lara and Pawel Mazur, who lived in the United Kingdom. Lara believed digital technology provided their 6-year-old son with opportunities to “build his confidence and make him independent” while Pawel was cautious and worried about online risks, “especially after [son’s friend] introduced him to a violent video game” (p. 1). Pawel therefore set passwords on all devices in an attempt to monitor and control his son’s access. Researchers have reported that media discussions of young children using technology, parents’ educational backgrounds, and their prior experiences of using technology for work, study or leisure all influence parents’ beliefs (e.g., Plowman et al., 2008, 2010; Teichert, 2017).

Children’s uses of digital technology in homes

For many young children, home is typically the first space where they encounter and experience digital technologies and media (Kervin et al., 2018), with the age of child influencing access to, and location of, digital tools. For example, Poveda et al. (2020) noted how much of younger children’s use occurred in general living spaces (e.g., the living room), which, unsurprisingly, contrasts with descriptions of older children who own their own digital devices and independently use them in personal spaces (e.g., bedrooms) (Livingstone and Blum-Ross, 2020).

Similar to the research on print literacy in families (e.g., Purcell-Gates, 1996; Taylor, 1983), studies have noted how children's use of digital technology was embedded in daily family life (Gillen et al., 2018; Kumpulainen et al., 2020; Livingstone and Blum-Ross, 2020; Ozturk and Ohi, 2019; Palaiologou, 2016; Teichert, 2020). Gillen et al. (2018) described it as "the rhythm of the day" (np) while Gee et al. (2018) noted the "dynamics of family interactions and routines, and how the meaning and use of media are caught up in these dynamics" (p. 9). Children demonstrate operational skills from a very young age (Gillen et al., 2018; Harrison and McTavish, 2018; Murphy and Headley, 2020; Poveda et al., 2020), but it is a misconception that children "just pick it up" (Plowman et al., 2008, p. 311). As Plowman et al. (2008, 2012) documented, children learn operational skills by observing more proficient digital technology users in their homes, notably parents and siblings. Parents scaffold children's uses (Davidson, 2009, 2010; Davidson et al., 2018; Gillen et al., 2018), even if they are unaware of it. Older siblings mentor younger siblings' digital engagement by playing alongside them and explaining how to operate the device and/or game (Davidson, 2010; Kervin et al., 2018; McPherson, 2011). However, once operational skills are developed, children show an adeptness at trouble-shooting when technology does not work and astute planning to organize resources to ensure proper functioning before engaging in tasks (e.g., Taylor et al., 2018).

Some researchers describe children's uses of digital technology at home as unplanned or fleeting and encounters may be more interstitial as children move between different digital games or videos and between imaginary play in offline spaces (Fleer, 2014; Marsh et al., 2017a; Plowman et al., 2012). Importantly, digital technology does not supplant other types of play children engage in while in their homes (Kumpulainen et al., 2020; Marsh, 2004; Marsh et al., 2016; Plowman et al., 2013). Children continue to engage in activities more traditionally associated with childhood, such as outdoor play, book reading, and non-digital dramatic play (Marsh et al., 2017b; Plowman et al., 2013; Teichert and Anderson, 2014). By design, Lego presents an interesting example of children's online/offline multimodal play as children manipulate physical bricks (e.g., build), while using visual paper-based instructions or accessing additional instructions online via websites or QRI codes (Roach O'Keefe and O'Keefe, 2020; Wong, 2015). Five-year-old Andrew, the focal participant in Wong's (2015) study went a step further and developed Lego instructional videos and posted them on YouTube.

Taken together, these studies indicate that when children interact with digital technology at home, they are not passive users. They re-enact what they see or play in a variety of ways, such as dramatizing the story lines or characters they know from TV, movies, YouTube, and video games (Barron and Levinson, 2018; Given et al., 2016; Huh, 2015; Marsh et al., 2015; Poveda et al., 2020; Stephens et al., 2013; Takeuchi and Stevens, 2011; Teichert, 2019). Sometimes children's dramatic play mimics what they are seeing online in-the-moment (Kervin, 2016; Kervin et al., 2018; Scriven et al., 2018; Teichert, 2020). Children shifting between online and offline formats has also been evident in their informational search practices. For example, a child expresses an interest in a topic and, typically alongside a parent, searches books, videos, and the Internet to learn more about the topic (Barron and Levinson, 2018; Davidson, 2009). In contrast to the notion of technology as a babysitter (American Academy of Pediatrics, 1999), families frequently use technology together, especially those with younger children (O'Hara, 2011; Kumpulainen et al., 2020; Livingstone and Blum-Ross, 2020; Marsh, 2004; Teichert, 2020; Wolfe and Flewitt, 2010). Therefore, rather than being seen as babysitters, digital devices might be considered as sites for shared family experiences (Plowman et al., 2013).

Staying in contact with family and friends is a frequently cited use of digital technology in homes (Teichert, 2020; Busch, 2018; Flewitt and Clark, 2020; Livingstone and Blum-Ross, 2020; Kumpulainen et al., 2020; Harrison and McTavish, 2018). Plowman et al. (2013), for example, described how 3-year-old Colin, who lived in the UK, proficiently took photographs and initiated video-chatting with family in Australia. Becker (2021) described a Brazilian immigrant mother and her 6-year-old daughter living in the US and the "unboxing" videos created in response to boxes filled with gifts they received yearly from relatives in Brazil.

In addition to staying in touch, digital technology may help children develop emergent print literacy skills (Bittman et al., 2012; Neumann, 2014) and has been cited as beneficial for children with speech disorders, when using apps approved by speech pathologists (Wren et al., 2018). Families have also reported online engagement as a way to develop heritage language skills (Harrison and McTavish, 2018; Takeuchi and Ellerbe, 2018), support bilingual/multilingual children (Barron and Levinson, 2018; Marsh et al., 2017b), or develop English language skills (Kumpulainen et al., 2020; Ozturk and Ohi, 2019). Language brokering of online materials has also been documented (e.g., Yip et al., 2018 with Hispanic youth in the US).

Although much of the research on digital literacy in families has focused on young children, as just noted, some studies have involved older children and youth. For example, Murphy and Headley (2020) examined the role of digital technology in teenage mothers' and children's literacy. They interviewed eight teenage mothers in an urban area in Canada about their recollections of their own early literacy experiences, their children's engagement in literacy, and their own current literacy practices, especially with regard to digital technology. All of the participants had a mobile phone or tablet and access to a computer. They reported using the digital devices for a range of functions and purposes, including, reading and writing different forms and genres of texts, accessing information and resources, creating artistic work, and for organizing their daily lives. They also indicated that digital tools could be distracting and worried about their own and their children's overuse of them.

Despite the wealth of observational data available, the majority of this work occurred in Western Europe, North America, and Australia. We know much less about families' digital literacy practices in the global south. Furthermore, many of the research participants describe themselves as middle class, and frequently live in metropolitan and suburban areas. Although efforts have been made to examine families in rural communities (e.g., Flewitt and Clark, 2020 in UK, Wong, 2015 in Canada, Roos and Olin-Scheller, 2018 in Sweden), more observational studies are needed to better understand how digital literacy is enacted in places where connectivity is less consistent and access to digital technology is limited.

As with print literacy, the research reviewed here reflects the theoretical perspectives outlined earlier. For example, mediation by a more experienced or significant other is highlighted in many of these studies. As well, digital literacy varies across contexts for different functions and purposes. Of course, digital literacy is multi-modal by design.

Family literacy programs

Before reviewing the research on family literacy programs and examining some examples more closely, it is important to acknowledge and discuss concerns about, and critiques of, these programs. For example, Purcell-Gates (2000) and Thomas and Skage (1998) identified a lack of assessment or evaluation in such programs, and from an ethical and accountability perspective, relatively little evidence that children and families were benefitting in various ways from their participation. Auerbach (1989) raised several issues, including: family literacy programs often target marginalized families, such as those living in poverty, and recent immigrants and refugees; families' home languages are often ignored and acquiring English (or the dominant language of the community) is promoted; and families' home literacies are unrecognized and school literacy is privileged. Reyes and Torres (2007) criticized family literacy programs for imposing middle class, Eurocentric values or practices on Indigenous families and those from culturally, linguistically, and racially diverse backgrounds and called for decolonizing family literacy programs (Crooks, 2019). Furthermore, some researchers have argued that family literacy programs are gendered (e.g., Cuban and Hayes, 1996; Rizk, 2020), designed with the assumption that mothers will attend sessions with their children and follow up with literacy activities at home, adding yet another expectation on them.

Assessing and evaluating family literacy programs

In the period since Thomas and Skage (1998) and others raised concerns about the lack of attention to program evaluation, several researchers have addressed this issue, including meta-analyses that focused on children's language and literacy learning. For example, Marulis and Neuman (2010) investigated the effectiveness of various programs on young children's vocabulary development. They reported a large effect size (0.88) for sixty-seven studies involving 5929 children. In their meta-analysis, van Steensel et al. (2011) identified studies in which researchers measured comprehension skills and print related or code skills. The thirty studies included 4326 children, of whom 1866 had participated in family literacy programs and 2460 were in comparison groups. The average effect size for the programs was 0.20, which is statistically significant but considered small (e.g., Cohen, 1988). Nevertheless, van Steensel et al. (2011) concluded that the programs had "a non-trivial, positive effect" (p. 88). More recently, Fikrat-Wevers et al. (2021) analyzed forty-eight studies and found an average effect size of 0.50 immediately after the programs but an effect size of 0.16 in follow-up measures. Finally, in a meta-study that did not involve calculating effect sizes, Brooks et al. (2008) found that children made gains in language and literacy in eighteen of the nineteen qualitative and quantitative studies and in four of the five studies that had follow-up measures, gains were sustained.

Despite these generally positive results, however, Paratore and Yaden (2011) pointed out, the federally funded Even Start program offered throughout the United States was defunded based on studies that indicated that the popular program did not significantly improve children's language and literacy learning. They questioned whether such large-scale programs, "perhaps impersonally implemented with varying quality goals, and even conflicting or unspecified theories of change ... work against the type of personal and professional cohesion" (p. 94) fundamental to the success of family literacy programs.

Although many studies focused on program impact on children's language and literacy learning as measured by standardized tests, some researchers have looked at other effects. For example, Swain et al. (2014) found that the 100 parent participants they interviewed from seventy-four programs in England indicated: they more capably supported children's learning; came to value education more; enhanced their understanding of schools/schooling; developed social connections; and became more interested and invested in their own literacies. Anderson et al. (2013) reported similar findings in a study in which they were able to locate ten of eighteen parents from a cohort in an economically depressed, rural community in Eastern Canada, who had participated in a community-initiated family literacy initiative with their 4- and 5-year olds two decades earlier.

These findings align with the perspective of noted British sociologist Diane Reay (1998), who grew up in a working-class home, that educators need to make explicit to culturally, economically and socially diverse families, exactly what they need to do to support their children's development and learning.

While research such as that just reviewed on the impact of family literacy programs have generally focused on children's learning and parents' learning about how to support their children, Toso and colleagues have looked at how mothers who participate in these programs personally benefit from them. For example, Toso (2012) found that the Mexican immigrant women in a family literacy program in the US, developed agency, appropriating the discourse about mothering to serve their needs and to meet the aspirations they had for themselves and their children. She concluded, "Family literacy, often seen as a site of colonization ... or imposition of normative ideas of parenting ..., offered a place to explore ideas of the self, thereby pushing the boundaries of women's traditionally held mothering discourses" (Toso, 2012, p. 4). Similarly, in their qualitative study, involving two family literacy programs in the United States, Prins et al. (2009) reported that the women experiencing conditions of extreme poverty who participated saw them as sites of social contact and support, outcomes that are often not assessed in family literacy programs or are ignored as being peripheral.

Maintaining and promoting first/home languages

Many programs continue to be offered in the dominant language in the community (e.g., English); however, educators have developed programs that include the first language (L1) of new immigrants and families of refugee status. In an initiative in Sheffield in the UK (Hirst et al., 2010), a cultural worker and an early childhood educator regularly visited sixteen families who had emigrated from Pakistan, providing literacy materials and demonstrating to families how they could support their children's learning. Families used their home languages, Mirpuri Punjabi or Urdu, or English at their choosing, as the facilitators did not privilege any language. The children made significant gains on the Sheffield Early Literacy Development Profile (SELD) (Nutbrown, 1997) in comparison to a control group. Parents/caregivers indicated that they benefited from participating and believed that the program should be available to other families. In a study of the Home Enrichment of Language and Literacy Skills (SHELLS) program with migrant workers in the western United States, Boyce et al. (2010) encouraged families to share their experiences in Spanish and facilitators then supported them in making books, based on the oral stories, that parents then read with the children. Findings indicated that the thirty-two children in the SHELLS program significantly increased the number of words they used, as well as the number of different words they used, compared to children in a control group. As well, parents in the SHELLS program significantly increased elicitation strategies compared to the control group. Anderson et al. (2011) developed and implemented the Parents as Literacy Supporters (PALS) in Immigrant Communities bilingual program with families from four different linguistic groups (Farsi, Karen, Mandarin, and Punjabi) in five communities in Western Canada (Anderson et al., 2011). The program encouraged children and families to maintain their home language as they simultaneously acquired/learned English as an additional language. An early childhood educator and a cultural worker from each community facilitated sessions for 4- and 5-year old children and their parents/caregivers in English and L1, all written materials were translated into home languages, and families received a dual language book at each session.

The program facilitators, guided by the cultural workers, incorporated as much as possible, the families' funds of knowledge—"the essential cultural practices and bodies of knowledge and information that households use to survive, to get ahead, or to thrive" (Moll and Greenberg, 1990, p. 321). Another principle of the program was respecting different cultural models of teaching and learning, acknowledging that in some cultures, children learn by first watching more proficient or experienced others (e.g., Rogoff, 2003), not by experimenting and approximating as advocated by many early childhood educators in western countries. Pre and posttest comparisons of the Normal Curve Equivalent Scores on the widely used Test of Early Reading Ability-2 (Reid et al., 1989), indicated that on average, the children made statistically significant gains with an effect size partial eta squared of 0.318, which is large (Cohen, 1988). Qualitative data from focus groups, field notes, debriefing sessions, and so forth, revealed that: the families: appreciated the bilingual format; increased their appreciation of maintaining their home language; developed greater understanding of western pedagogy; became more comfortable in school; and believed children's transition to kindergarten would be smoother. As other studies have found, the program helped demystify early literacy development and learning. However, the families also raised concerns and issues and requested more frequent sessions, extension of the program for older students and their parents, and more direct instruction (Anderson and Anderson, 2021a,b; Anderson et al., 2017, 2016, 2011).

Building on cultural capital and funds of knowledge

A goal of some programs is to build on participants' cultural and social capital and funds of knowledge. A good example of such an initiative was Project FLAME- Family Literacy Aprendiendo Mejorando Educando (Learning, Bettering, Educating), developed by Professor Flora Rodriguez Brown and colleagues with Spanish speaking families in Chicago (Rodriguez Brown, 2004, 2008). Parents who attended had children between 3 and 9 years of age. Adults attended bi-weekly, English as a Second Language classes and bi-monthly classes that focused on parents as teachers. Rodriguez Brown (2004) reported that both adults and children improved their literacy knowledge and skills, and that adults increased their confidence and self-esteem, which led to more involvement in the wider community and more social inclusion.

Oral language is the focus of the Parent-Child Mother Goose Program (P-CMG) where parents and young children share familiar poems, riddles, songs, stories and so forth in a group setting. Started in Toronto, Canada in 1984, the low-barrier, participatory program spread and is currently offered in many parts of Canada and elsewhere (The Parent-Child Mother Goose Program, 2021). Originally offered in English, it has expanded to include other languages and is offered in a variety of venues, including community centers, libraries, Aboriginal friendship centers, etc. (P-CMG, 2021). Indeed, during the Covid-19 pandemic, the public library in Coquitlam, British Columbia offered the program virtually in Mandarin (Coquitlam Public Library, 2021). The multi-modal program is interactive and includes movement, oral language and print versions of the poems, songs, etc., shared in sessions. Several studies have examined the effects of P-CMG. For example, in a study conducted in the state of Victoria, Australia, Terrett et al. (2012) found that the thirty children who attended P-CMG sessions made greater gains than the twenty-five children in a control group on measures of expressive language. Parents in P-CMG also reported feeling less stressed than those in the comparison group. In a study with families of children with hearing impairments in Iran, Koochi et al. (2017) reported that mothers and children benefitted from P-CMG. Likewise, based on interviews with participants in Ontario, Canada, Ling et al. (2017) reported several benefits of the program, including increased opportunities for parents to socialize.

As described earlier, besides promoting first language maintenance, the PALS program attempted to incorporate families' funds of knowledge, and respected and welcomed different cultural models of learning in working with culturally and linguistically diverse families. Alongside the PALS in Immigrant Communities initiative (Anderson et al., 2011), Gail Stromquist, coordinator

of Aboriginal Education for the Langley School District in British Columbia, worked with elders, community members and colleagues to develop a version of PALS for Aboriginal families and communities. Aboriginal PALS promotes Aboriginal culture(s) of British Columbia and encourages families to use the Indigenous language of their territory, many of which are endangered because of assimilationist and racist policies of governments in the past. First Nations (Aboriginal) communities throughout BC have implemented (and in some cases, locally adapted) the program. For example, Alison Gear, the Early Childhood Coordinator for the Haida Gwaii School District in northern British Columbia, collaborated with families and the broader community in developing Haida Gwaii PALS. Ensuring that the program content reflected the place-based orientation of Haida culture, as well as First Nations principles of learning ([First Nations Education Steering Committee, 2022](#)), [Gear \(2013\)](#) designed the project to be a “means of addressing the imbalance between Indigenous and Western knowledge systems currently offered through the public education system” (p. ii). Families appreciated having a program that reflected their culture and indicated that they and their children benefitted.

As these examples demonstrate, family literacy programs can be sites for sharing knowledge with families and supporting children’s language and literacy development, and at the same time, valuing and incorporating families’ cultural and social capital.

Gender and family literacy programs

Some family literacy programs appear to target mothers and to place additional childrearing demands and responsibilities on them (e.g., [Mace, 1998](#); [Rizk, 2020](#)) and fathers tend not to participate in them to the extent that mothers do ([Lynch and Prins, 2021](#); [MacLeod, 2008](#)). As would be expected, educators have developed initiatives designed for fathers in response to calls for their greater involvement (e.g., [Gadsden, 2012](#)). For example, the Vancouver Public Library in Canada developed the Man in the Moon Program to provide “opportunities for fathers and other male identifying caregivers to learn about how to best support early literacy and language development in their children through playing, singing, talking and reading together” ([Vancouver Public Library Foundation, 2021](#), n.p.). Feedback from participants has been positive and the program has run for nearly two decades. [Kagitcibasi \(2005\)](#) reported on a 22 year longitudinal study with fathers who participated in the Fathers Support Program in Turkey and found that they tended to become more involved with their children, adapted a more democratic, less authoritarian stance with children, and developed a supportive network with other fathers (p. 85). More recently, several researchers have worked with programs for incarcerated fathers (e.g., [Nutbrown et al., 2019](#); [Prins et al., 2020](#)). Using an interpretivist frame, Nutbrown et al. reported on a 5-month project sponsored by an interdisciplinary team in which males, incarcerated in two prisons in the United Kingdom, participated in a series of workshops and family visits. The authors concluded that the program supported fathers in committing to supporting their children’s literacy learning while in prison and resolving to avoid involvement in crime and to take up more parental responsibilities upon release. Of course, it remains unknown whether family literacy programs for fathers relieve some of the inequitable demands and expectations placed on mothers (e.g., [Rizk, 2020](#)).

As can be seen, some family literacy program developers and facilitators have attempted to respond to the concerns raised over the years to make programs more socially and culturally responsive; encourage fathers (men) to become more involved in them; shift away from a focus only on print and incorporate multiple literacies, and promote plurilingualism.

Conclusion

In the four decades since Denny Taylor published her work, research and scholarship in the field of family literacy has continued to grow and expand globally. Important naturalistic studies have helped broaden conceptions of families beyond parent-child dyads and extend the focus on other modes besides print. Many studies have exemplified the social nature of literacy and language development and learning in homes and communities, and shown the important roles that mediators perform. At the same time, these studies challenge the well-entrenched notion that parents and significant other adults such as grandparents necessarily are the mediators for children. As well, studies have demonstrated the range of languages and literacies that occur within homes and communities and the different formats, genres and modes that are employed in constructing and communicating meaning. Many researchers have examined how families take up digital literacies but there is still much to learn in this area.

Much of the literature has come from the global north, and especially western countries. More research from the majority south would broaden and deepen knowledge and understanding in the field. As mentioned, a great deal of the naturalistic research in family literacy has focused on young children. Naturalistic studies with older children, youth and adults would broaden our knowledge. As well, longitudinal studies in different cultural and social contexts, which document literacy practices within families over time, would enhance our understanding. Although research on families’ digital literacy has proliferated over the last decade or so, there are still gaps in the literature, especially in terms of access to digital tools and technology across socio-economic groups, as issues of equity and inclusion remain.

There is evidence that children and families benefit from family literacy programs in various ways; however, there is a dearth of longitudinal studies in the field. Although these pose logistical and pragmatic challenges, they would add considerably to our knowledge. For example, such studies would demonstrate whether the positive impact on children’s language and literacy learning that many of the studies reviewed earlier have documented are maintained as children progress through elementary and secondary school. Tracking child participants over the life course to determine the impact of programs in a number of domains, as was done in the Perry Preschool Project in Ypsilanti, Michigan starting in the 1960s ([Highscope, 2022](#)) would be insightful and valuable.

As well, there is a continued need to conceptualize assessment and evaluation broadly, beyond just scores on fairly narrow measures of language and literacy. For example, relatively little is known about whether programs change families' literacies practices at home. That is, do families maintain vernacular literacies or do their practices become school-like, does the amount of reading and writing and other forms of literacies that families engage in change as they participate, do families' conceptions or definitions change and if so, how, and do families take up more critical stances in their literacies? Finally, while some researchers have documented adult participants' perspectives or views of the program, we know relatively little about children's views of their experiences.

The research on family literacy programs tends to focus on cognitive outcomes for children. However, some researchers have reported affective and social benefits such as parents feeling more included in the school and community, parents' increased feelings of self-efficacy, and greater understanding of families, their context, and cultural practices on the part of teachers. We believe that programs that are authentically strengths-based can make important contributions to family-school relationships and to family life; thus assessment and evaluation need a greater focus in these areas.

While family literacy programs continue to be a contested phenomenon in some quarters, they continue to operate in many areas of the world and there is still considerable interest in them. As we indicated, developers and facilitators of family literacy programs have attempted to address the concerns and issues and to make programs more culturally and socially responsive, with varying degrees of success. Indeed, we see a need for ongoing assessment/evaluation of programs with an aim to improving them to meet the aspirations and needs identified by families and communities. Just over two decades ago, Hendrix (2000) asked the question, "Family Literacy Education—Panacea or False Promise?" Concurring with Toso (2012), we conclude that family literacy programs are neither, but there is still much to learn about them.

The origins of family literacy programs

The roots of family literacy as an educational method come from the belief that the parent is the child’s first teacher (Edwards, 2016). The term “family literacy” was first used over 30 years ago to describe discourse within the family (Taylor, 1983). Family literacy has origins in the United States, Canada, and South Africa, and since 1983 has emerged as a new and distinct field of inquiry, made prominent during Barbara Bush’s time as Second Lady while her husband was the then Vice President and President of the United States (White House, 2009). Barbara Bush called family literacy “the most important issue we have” (White House, 2009). Her dedication to eliminating the generational cycle of illiteracy in America by supporting programs where parents and their young children were able to learn together significantly affected the advancement of families of color. US legislative definitions such as the *National Literacy Act of 1991*, spurred on by the war on poverty (National Public Radio, 2004), soon followed, defining literacy as “an individual’s ability to read, write and speak in English and compute and solve problems at levels of proficiency necessary to function in the job and in society, to achieve one’s goals and to develop one’s knowledge and potential” (Library of Congress, 1991, np).

By 1997, when *H.R. 1385 was passed by the House* (Library of Congress, 1998), the United States saw an increasing recognition of the need to move beyond an emphasis on children to a more explicit focus on parents and families, a large number of whom were families of color. *Family literacy services* thus came to connote “services provided to participants on a voluntary basis, of sufficient intensity in terms of hours, and of sufficient duration, to make sustainable changes in a family (such as eliminating or reducing welfare dependency)” (Association of Centers for the Study of Congress, 2021, np). The United States then saw family literacy emerge to integrate interactive literacy activities between parents and their children, equipping them to partner with their children in learning, providing parent literacy training for economic self-sufficiency, and offering appropriate instruction for children of parents receiving parent literacy services. School programs such as Reading Is Fundamental (RIF) (2021) and Title I, which were originally designed for school-age children, also incorporated programs for families, and Head Start demonstrated that parents’ participation produced greater school success than programs without parent involvement. Initiatives such as the PACE/Kenan

project in Kentucky developed a successful model for teaching literacy skills to both parents and children, in which content skills were supplemented by parent education and parent-child activity time. In addition, the federal legislation for family literacy, based on the Kentucky model and shepherded by Representative William Goodling from Pennsylvania, ushered in Even Start in 1988 ([Even Start Family Literacy Program, 2014](#)).

Even Start Family Literacy further reinforced the need to break the cycle of poverty and illiteracy, which remained a concern for families of color, by working to improve the educational opportunities of the nation's low-income families through integrating early childhood education, adult literacy or adult basic education, and parenting education into a unified family literacy program. Through cooperative projects that built on existing community resources to create a new range of services, *Even Start* promoted achievement of the National Education Goals ([Legal Information Institute, 1994](#)) and assisted children and adults from low-income families to achieve challenging state content standards and student performance standards. In doing so, *Even Start* functioned to advance a national agenda dedicated to a focus on increasing literacy opportunities for children, a large majority of whom were from families of color ([U.S. Department of Education, 2004](#)).

It was no wonder then, that the US Congress, via the 1998 *Adult Education and Family Literacy Act*, created a definition for adult literacy, describing it as "an individual's ability to read, write, and speak in English, compute and solve problems, at levels of proficiency necessary to function on the job, in the family, and in society" ([Literacy Information and Communication System, 2021](#), np; [U.S. Department of Education, 1998](#)). With this definition, family literacy education claimed to experience a shift from traditionally preparing children to read, write, speak English and use computation skills to enabling children as well as adults to apply these skills in the workplace and community to use information to solve problems.

Importance of generational influences and connectivity to community

On the global scale, these variations in terms of how family literacy was emphasized, both legislatively and nationally in the United States, were interrogated by the *International Reading Association's Family Literacy Commission* ([Morrow et al., 1993](#)). The then International Reading Association (IRA) perceived family literacy as encompassing the ways parents, children, and extended family members use literacy at home and in their community. Focusing more on honoring the literacy practices of families (of color) as opposed to school-valued literacy practices, IRA established that family literacy may be initiated purposefully by a parent or may occur spontaneously as parents and children go about the business of their daily lives ([Morrow, 1994](#)). Deviating slightly from this international view of family literacy, and aligned more closely with US legislation, the United Nations Educational Scientific and Cultural Organization (UNESCO) then described family literacy as "the development of the literacy, numeracy and language skills of both children and adults" across families and generations ([UNESCO Institute for Lifelong Learning, 2017](#), p. 3). In conceiving of family literacy across international domains, UNESCO also advocated the idea of family learning that functions as a "broader learning activities including, but not limited to literacy" ([UNESCO Institute for Lifelong Learning, 2017](#), p. 3). Family learning therefore represented "a transformative approach that works across generations and between institutions, breaking down barriers between home, school, and community" ([UNESCO Institute for Lifelong Learning, 2017](#), p. 1).

Reenvisioning family literacy for families of color

While the emphases of family literacy education across domains appeared to differ, and despite no clear indication that the international focus of IRA (now the International Literacy Association) and UNESCO were geared toward families of color, it can be argued that the majority of the world's population constitutes families of color ([Ferris, 2015](#); [Race of the World Population, 2022](#)). National and international conceptions of family literacy in the US have thus far located family literacy as a key mechanism for supporting families of color across the globe by operating at the nexus of (a) early childhood, preschool and primary education and (b) adult and community education (see [Hanemann et al., 2017](#); [UNESCO Institute for Lifelong Learning, 2017](#)). In doing so, the focus on family literacy and learning on the international scale is envisioned as a mechanism for impacting educational outcomes, life success, bonding between parents and children, connecting schools, organizations and communities and reducing school drop-outs ([UNESCO Institute for Lifelong Learning, 2017](#)), particularly for a large majority of families of color. Yet, the alignment of UNESCO with legislative notions of family literacy in the US as opposed to conceptions of community and culturally-valued practices of families (of color) by ILA presents a conundrum.

This conundrum places family literacy in the 21st century at an impasse, one which requires a re-envisioning of the underlying ways of enacting and supporting the literacies of families of color. The increasing recognition that children begin to learn literacy prior to formal schooling in the US and across the globe, and that family contexts shape literacy development, has had profound implications for the field of early literacy. Beyond this, for the past 30 years, parent involvement in children's education has been expanding, leading to further transformation in the definition of family literacy. In addition, although family literacy originated as a concept describing the rich and varied ways that families use literacy in home and community settings, it has increasingly become associated with formal programs aimed at improving the literacy of parents and their young children. Notwithstanding, there remains a continued need for family literacy that addresses literate equity for families of color as evidenced in the International Literacy Association's recent *What's Hot in Literacy Report* which highlighted "family engagement in literacy learning" as one of

the top four key responsibilities of literacy educators, and the “variability of family engagement in literacy and learning” as one of the top three barriers to equity in literacy education ILA, 2020 (ILA, 2020, pp. 17–18, 22).

While geared toward many families of color in its focus, intention, and implementation, the evolution of family literacy over the past 30 years has not explicitly identified variations in what a family literacy agenda that explicitly supports families of color might entail. Specifically, given recent indications of the ways in which race and racialized ways of thinking about language continue to undergird literacy, English language arts, and bilingual curriculum (Anya, 2020; Flores, 2020; Nalubega-Booker and Willis, 2020; Smith et al., 2020) of families of color even while these families wrestle with institutional norms and practices to advance their economic and social futures (Rosa and Flores, 2017; Smith et al., 2020), it is reasonable to question the degree to which family literacy education and its corresponding programs have centered and complicated elements such as race in literacy curriculum, assessment, programs, and practices of populations of color.

Family literacy education has arguably created change, ranging from a focus on sustaining informal family interactions among parents and children driven by the need to eliminate intergenerational cycles of poverty to more formal and federally funded programs driven by legislative definitions that advance traditional literacy skills, life skills as well as problem-solving skills deemed necessary to enhance opportunities for both parents and children in families to overcome challenges posed by illiteracy. Yet, a persistent concern lingers that family literacy programs can do much more to balance the development of programs with an adequate emphasis on the community and cultural practices of families of color, a dynamic critical to enhancing teachers’ capacity to support parents and children in and beyond schools, both in the United States and across the globe.

To advance this argument, we first discuss family literacy and its evolution over time, taking into consideration local and global realities of families, and particularly, families of color. We then describe family literacy implementation and programming in the US followed by a discussion of the same across the globe, highlighting the ways in which these initiatives may have potentially deterred the economic or social realities of families of color even while perceived as advancement. Subsequently, we discuss long-standing efforts to examine and support the literacies of families of color, pointing to key indicators that characterize these research and community practices. Finally, we identify key insights gleaned from our discussion by presenting certain culturally relevant literacy practices that can sustain the literacies of families of color and proposing a way forward for the field.

Conceptions of family literacy

In the evolution of family literacy over the past 30 years, it is clear that this term means different things to different people. What it might mean for families of color, however, remains underexplored. *Family literacy*, broadly conceived, refers to the interactions of parents and children using language—talking, playing, exploring, limiting, soothing, explaining, encouraging, and nurturing. With the support of the adults in his or her life, a child learns to navigate his or her world with the help of language, acquiring limits and self-control, making choices, and solving problems, communicating needs to others, developing emotional ties to parents and siblings, and responding to the print environment surrounding him or her. In recent decades, the focus of *emergent literacy* has shifted from learning to read in the first grade to preschool interactions in the home environment and from the first-grade teacher to the parent as first teacher.

We have shown earlier that a second use of the term *family literacy* applies broadly to the federally funded programs, typically originating from the US context, developed to support intergenerational education for at-risk, low-literacy families—programs such as Head Start, Even Start, and Title I (Even Start Family Literacy Program, 2014; U.S. Department of Education, 2004; U.S. Department of Health and Human Services, 2019). The legislation authorizing these programs contains a uniform definition of *family literacy* that has typically entailed four components:

- Adult basic education to improve basic skills, prepare for the (GED) certificates, and to learn workplace skills that leads to economic self-sufficiency;
- Early childhood education for preschool and school-age children to help them prepare for success in school and life experiences;
- Parent education in which parents and caregivers discuss parenting practices and the importance of literacy experiences in the home;
- Parent and child together time (PACT) for adults and children to practice literacy activities together.

While improving their reading, writing and math skills, the assumption was that parents have an opportunity to practice language strategies with their children in areas such as storybook reading, discipline, and play and exploration. These skills are integrated into units arising from family issues, citizenship, and workforce readiness.

Doyle (2012) has argued that three major factors affected such trends in how family literacy was conceived in the United States: (a) developmental theory; (b) research on emergent literacy and parent involvement; and (c) sociopolitical developments. Developmental theory and research on emergent literacy during the 1960s appeared to work together to inform novel approaches to educational practice and social policy. Among the concepts introduced at this time were children functioning as active participants in their learning, the use of environmental supports to improve learning avenues for underserved children, and the presence of theoretical foundations that informed movements surrounding interventions from which the intervention movement developed. Later on, during the 1970s, the use of systems theories reflected how ecological perspectives could potentially clarify the nuances involved in child development which saw an increased emphasis on interventions. And in the 1980s, educational and social fields increasingly addressed “family literacy” as a construct leading to the continued emergence of programs that reflect varied degrees of

intensity, myriad forms of resources and a variety of goals, all dependent on the ways in which political and social shifts were manifested at that time.

Thus, despite the earlier recognition of ecological perspectives and the centering of the child as active participant, the subsequent shift toward intervention and programs superseded the cultural ways of being of children and of families of color, resulting in a current context where school-valued literacy practices positioned continue to be privileged over the community and cultural literacy practices in family literacy education. There is no doubt that parents, children, and communities of color can benefit from family literacy programs. Not only do individual literacy skills of parents and children improve but social skills increase, and families place higher values on education. Parents' expectations of their children change as they learn more about the continuum of child development. Parents become more involved in their children's schools as they better understand new educational approaches and recognize the important role they have as partners with teachers in their children's education.

For most, *family literacy*, whether spontaneous or promoted by formal programs, is a process of incorporating the spoken and written word into meaningful activities within the family unit. This becomes the legacy of language practices that passes from one generation to the next. However, to explore family literacy education as a promise of enhancing literacy opportunity with undue recognition of the cultural wealth of families of color is to inadvertently negate the already-present literacies (Marciano and Watson, 2021) that they possess.

Approaches to family literacy implementation in the United States

Specific family literacy programs

In the United States, family literacy legislation has allowed for more intensive programming known as the *comprehensive* or *four component* family literacy model (National Institute for Literacy: NIFL, 2001). The four components entail academic upgrading for parents, an early childhood development program, parenting and early literacy development, and a parent-child together (PACT) time, in which parents spend quality time with their children and try out new literacy ideas with them. Elements of this model are visible in initiatives such as The Even Start program (described earlier), which has catered to numerous families of color in the United States. They are also visible in the program, Reach Out and Read (ROR) (<http://www.reachoutandread.org/>), which began in Boston in 1992, and involves pediatricians, other professionals, and nonprofessional members of the community, supported numerous parents of color to lay the foundations for literacy during their children's 1st years of life. ROR used the pediatric office or clinic to bring together young families, pediatricians, volunteers, and children's books.

A third program reflecting elements of the comprehensive literacy model is Imagination Library, operating since 1995 and visible in Canada, the United Kingdom, and Australia. Imagination Library functioned as a book giveaway program in the United States, giving a free book per month to children, including children of color, from the time they are born until they begin school with about 1.4 million children are currently registered with the program and over 122 million books have been distributed since inception (Imagination Library, n.d.). Finally, a fourth program is the Laura Bush initiative where public library staff were dedicated to helping children and adults (of color) through a large variety of services and programs that promote family literacy (The Laura Bush Foundation for America's Libraries, 2021). And often overlooked are innovative family literacy programs involving correctional facilities in which people of color continue to be significantly overrepresented in the US, which cater to inmates usually separated from their families and help incarcerated parents develop the literacy of their children through enhancing their own literacy-building and parenting abilities (e.g., Georgetown University family literacy program for inmates of the District of Columbia: D.C. Family Literacy Project).

Undergirding philosophies of family literacy programs

Across such family literacy programs, three philosophical approaches have been identified: (a) the *intervention/prevention* approach; (b) the *multiple literacies* approach and (c) *critical literacy* and *social change theories* approach. Family literacy programs reflecting an *intervention/prevention* approach aim to compensate for perceived inadequacies in parenting behaviors and home literacy activities, believed to negatively affect children's readiness for school (Darling, 1993). A second broad approach to family literacy programming is known as *multiple literacies*, which is informed by anthropological, sociolinguistic, and sociocultural studies. Here, literacy is seen not as a single skill, but rather as a set of practices grounded in social contexts and social roles (Barton, 1994). A third broad approach is associated with critical literacy and social change theories, informed by the work of Freire (1985) and Giroux (1988). These programs present family literacy within a broader context of social inequities that shape power relationships among families, schools, and the broader society.

Evidently, the discussion of family literacy programs in the US thus far reveals a heavy emphasis on the *intervention/prevention* approach, which highlights the ways in which the literacies of color may have been potentially overlooked even while such populations appear to be supported by family literacy programs. As highlighted by Schwartz (1999), family literacy programs undergirded by the intervention/prevention philosophical approach reflect three primary elements: (a) adult education involving instruction surrounding reading, writing, computing, and problem-solving and that considers attention to English as a Second Language, General Educational Development (GED) classes and jobs skills training; parenting education involving the support of families as active participants in their children's education both in the home and school; and early childhood education geared

toward preschool children. For families of color, such an approach is geared toward addressing deficiencies in literacy for adults as well as children by instilling in them the literate practices and norms privileged by schools and the broader society.

Debates about family literacy in the United States

It is no surprise then, that persisting tensions in how family literacy education is proposed broadly for families via an intervention/prevention approach that inadvertently sidelines the needs of families of color have resulted in numerous debates. These debates stem from the pervasive presence of the *intervention/prevention approach* in family literacy programs despite the indication of the potential of approaches such as multiple literacies, critical literacy & social change theories for families of color. The growing popularity of family literacy to address illiteracy, poverty and to advance the opportunities of underserved families in a context of national and global racial crises, exacerbated by a global pandemic, have led such debates to take on new importance. Among those debates are tensions persisting in family-school relationships, the focus on early childhood by family literacy programs, the central role of storybook reading and the lack of a longitudinal focus over time.

Family-school relationships

A key issue in family literacy is the relationship between home and school, and, more specifically, between literacy as valued and practiced in homes and literacy as valued and practiced in schools. Shirley Brice Heath, in 1983, showed how family values and communication patterns contributed to differences among white children and African-American in two very small communities just a few miles apart, and how children in both these small communities differed from children who grew up in the nearby town. Despite efforts made since then, the mismatch between home and school literacy has remained a topic of ongoing concern and debate. For instance, in the US, many children from homes with low-income, and for whom English is a second language, continue to score below their more privileged peers on standardized tests and in overall academic performance (Gunderson and Clarke, 1998a,b; The Nations Report Card, 2020). For children and adults of color, particularly, this mismatch is further exacerbated as their racialized linguistic and literate practices often remain unaddressed by the limited opportunities presented in Eurocentric and Westernized approaches to literacy curriculum and standards in schools (Milner, 2012; Rosa and Flores, 2017; Smith, 2019; Willis, 2015, 2018).

It is for this reason that family literacy programs and research are best understood within a broader social, cultural, racial, and economic policy context. Scholars have linked the growth in family literacy programs with a concern over what is termed the literacy crisis, high dropout rates, and low academic achievement (Auerbach, 1989), challenges historically associated with families of color, emphases that continue to be mirrored in UNESCO's approach to family literacy (UNESCO Institute for Lifelong Learning, 2017). And national studies and policies in North America and the United Kingdom such as the International Adult Literacy Survey (OECD, 1996) and the United States' Equipped for the Future Initiative 2000 (UNESCO Institute for Lifelong Learning, 2017) increasingly look beyond schools to families as the source of both the problem of and the solution to the low school achievement of minority and low-income children, a large majority of whom tend to be students of color.

The understanding of family in such policies, historically and contemporarily, has nonetheless been limited primarily to mothers, primary caregivers, and their young children (UNESCO, 2008). This phenomenon prompted Jane Mace to comment:

The evidence of the literacy problem in industrialized countries with mass schooling systems has revealed that schools cannot alone meet this need. Families must therefore be recruited to do their bit, too. This is where the spotlight falls on the mother. She it is who must ensure that the young child arrives at school ready for school literacy, and preferably already literate (Mace, 1998, p. 5).

Early childhood focus

Another area of debate in the family literacy field is the wisdom of designing family literacy programs mainly for children from birth to 5 years old and their primary caregiver—usually the mother or grandmother. This has raised concerns about ignoring the literacy and learning needs of alternative families, as well as of older children, youth, and adults, a large number of which tend to be part of families of color. Luke and Luke (2001) make the case that the needs of adolescents experiencing literacy difficulties and their families are largely ignored, and resources are directed almost exclusively to young children.

Focus on storybook reading

A third and largely debated focus is storybook reading. Although ethnographic research with families reveals myriad forms and functions of reading and writing in daily life, many family literacy programs focus on reading story books to children as the way (Pellegri, 1991) to support children's literacy development. This emphasis on storybook reading apparently emanates from early research with precocious readers (Clark, 1976). This research, conducted mainly with white, middle-class families, indicates that reading to children was a common factor. Several criticisms, however, have been raised about the emphasis on storybook reading. First, clear evidence shows that young children's literacy development is supported in many different ways in addition to storybook reading (Hadley et al., 2020; Taylor, 1983). Second, storybook reading is not common across all cultures and social classes; by emphasizing it, the literacy practices of minority and other groups are devalued (Meier, 2003), much like is done for students of

color. Third, not all children enjoy being read to, and the implication that it is necessary in order for children to learn to read causes some parents to insist on their children's participation. Scarborough and Dobrich (1994) cautioned that some children consequently develop negative attitudes toward reading and there are those who have observed that despite the importance placed on storybook reading, the empirical evidence suggests that it plays a less significant role in learning to read than is commonly believed (Saracho, 2017; Scarborough and Dobrich, 1994).

Absence of longitudinal focus

Another concern related to family literacy policies is the lack of longitudinal studies documenting their impact over time. Adele Thomas describes much of the research in family literacy as "testimonials" (Thomas and Skage, 1998, p. 20), suggesting that little attention has been paid to broad measures of program effectiveness, raising questions about the degree to which these largely implemented mechanisms result in an increase in literacy gains for families of color as well as decisions surrounding how to evaluate measures used to gauge effectiveness.

In each of these debates, the needs of families of color appear to be affected, further emphasizing a re-envisioning of the construct and emphasis of family literacy and inviting a response from scholars focused on such needs.

Responses to family literacy debates

In response to the foregoing debates about family literacy, Wiley (1996) has identified three key elements useful for research communities working with families: *accommodation*, *incorporation*, and *adaptation*, all of which appear to bode well for advancing family literacy for families of color. According to Wiley (1996), *accommodation* places the responsibility for having an enhanced understanding of the ways in which students engage in communicative styles and literacy practices on educational stakeholders. *Incorporation* invites researchers to make understudied and undervalued community practices a priority, to study these practices and to integrate them into the curriculum by acknowledging the ways in which various ethnic groups can decenter mainstream curriculum practices often prioritized in schools. *Adaptation* proposes that children and their families, who are often perceived as having knowledge and skills that are often undervalued, can be expected to master the norms of schools.

Notwithstanding, adaptation approaches, which tend to be popular in family literacy implementation, have faced criticism (e.g., Yaden and Paratore, 2003). For instance, there are those who claim that these programs promote "blaming the victim" (Cairney, 1997; Nieto, 1992; Shockley, 1994; Street, 1995), perpetuating a dynamic where a deficit-oriented approach is taken that tends to mirror a "neoliberal Savior" (Brown, 2013) mentality. These arguments challenge the basis for family literacy programs which imply that the homes of poor, minority, racialized and immigrant children are "lacking literacy," an assumption increasingly identified as the result of White supremacist notions of what it means to use language based on Eurocentric norms in literate practice (Anderson and Stokes, 1984; Auerbach, 1989; Chall and Snow, 1982; Delgado-Gaitan, 1987; Erickson, 1989; Goldenberg, 1984; Rosa and Flores, 2017; Willis, 2018). Others argue that such programs do not recognize that "literacy is not something which can be pasted on to family life [but as] deeply embedded within it" (Macleod, 1996, p. 130) and perpetuate "the 'we know, you don't know' dichotomy" (Shockley, 1994, p. 500).

To address such criticisms of the adaptation approach, Edwards (1995) has invited scholars to pose questions such as the following:

- Where have researchers' fears, doubts, reservations come from?
- What do researchers think these parents are being "forced" to read?
- Does evidence exist where researchers have interviewed parents who have attended these family literacy programs?
- Is it fair for researchers to insert their own personal feelings about parents participating in family literacy programs without highlighting parent voices, perceptions, and evaluations?
- Are researchers' fears, doubts, and reservations justified? (p. 562)

Also, in response to these debates, scholars such as Li (2012) have invited a consideration of the pedagogy of cultural reciprocity in parent-teacher interactions across home and community where the teacher engages in personal inquiry and change while the parent also explores personal change and empowerment. This perspective, Li believes, can be fostered through school structural change, classroom pedagogical change, change in the home school relationship and change in perspectives on underserved student populations, creating opportunities in family literacy practices for families, including families of color.

Overall, approaches to family literacy implementation in the United States have reflected a wide range of programming efforts as well as a theoretical, conceptual, philosophical, and practical underpinnings that emphasize the intervention/prevention as well as adaptation approach to family literacy, creating a situation where the literacies of families of color are inadvertently sidelined. Despite numerous initiatives such as book giveaway programs that emphasize traditional literacy skills and remain prevalent and touted as impactful to family literacy (DeBondt et al., 2020), the enduring debates, many of which have centered primarily around cultural mismatches between the school-valued literacy practices and cultural literate norms of students in the home reinforce the need for a re-envisioning of family literacy education and programs for families of color in the United States.

Approaches to family literacy across the globe

While the historical basis for family literacy originated with the United States, Canada, and South Africa, increasing initiatives across the globe in both the Minority and Majority World focus on family literacy which reflect large populations of families of color (see Panelli et al., 2007 for a discussion of the labels, “Majority” and “Minority” World). Globally, research on family literacy has tended to be driven by Western notions. Yet, families of color around the world have always engaged in intergenerational literacy learning and practices. UNESCO has been a driving force in identifying what countries are doing globally with regards to family literacy practice from both a research and practitioner perspective. A report conducted by the UNESCO Institute for Lifelong Learning (UIL) reflects findings from the 10-year Literacy Initiative for Empowerment (LIFE) (2006–2015) focused on 35 countries worldwide where the literacy rate was lower than fifty percent and/or the adult population reflected over 10 million people lacking literacy competencies.

Among the findings reflected in this report are the ways in which family literacy, when considered at the international level, mirrors to some degree, an emphasis on traditional literacy support structures for the child, traditional literacy support structures for the parent, emphasis on the literacy connections between parents and children, and a focus on developing intergenerational literacy capacity and centers lifelong learning (UNESCO, 2008, p. 6). These findings are compelling because they reinforce the need for a focus on the cultural differences that come to bear on constrained literacy skills (Paris, 2005) if the multiple and critical literacies (Luke, 2012; Street, 1995) of students and families of color are to function as a basis for empowerment. The findings highlight the need for centering such literacies within contexts where, to leverage literacy practices is to consider the cultural norms of students, their parents, and the overall families as they operate within various contexts across the globe.

In the following overview of literacy programs captured internationally across different countries and contexts, many of whom reflect families of color (Desmond and Elfert, 2008; UNESCO, 2008), we illustrate how a number of the afore-mentioned findings are reflected (see Table 1). Through this illustration, it is clear that opportunities exist where cultural norms and the multiple and critical literacies that they invoke, as well as policy-orientated approaches to family literacy within nations, might become more central as an area of need when addressing family literacy, given the traditional notions that persist in many of the contexts explored.

Insights from international family literacy programs

Across the programs presented in the afore-mentioned countries (Table 1), significant variation exists in terms of the time allocated for programs. Just as was observed earlier in the US context, there are a number of situations in which certain countries reflect governmentally operated programs while others reflect programs operated under the auspices of National Government Organizations (NGO’s) because of limited visibility in policies designed to guide family literacy practices. In certain instances, communities appear to be included in family literacy programs while in many others, communities as a whole were not. There seems to be significant variation in how emphasis is placed on literacy across the Global North with predominantly White populations and Global South with predominantly families of color; the North features a heavier emphasis on literacy than the South. There are indications that the distance between schools and communities affects the ability of parents and children to navigate transitions and there seems to be a needed distinction between adult literacy programs and family literacy programs where the focus is placed on the individual vs. the parent-child relationship, given that all of programs, regardless of an individual focus, often fall under the same umbrella term, *family literacy* (UNESCO, 2008).

Among the programs presented in Table 1, it was further observed that most programs appear to target children or their parents. Very few programs seem to reflect a focus on parents and children in tandem or an equal focus on the parent and child, a shift that seemed to be partly reflected in the United States. There were a number of instances where mothers are explicitly targeted by programs, in alignment with earlier observations by Mace (1998) but no instance where fathers are an explicit focus. Much like was observed earlier in the US context, most programs focus on early childhood or elementary contexts while fewer programs focused on youth (UNESCO, 2008). Only one instance was identified where bilingualism was acknowledged and addressed (UNESCO, 2008) and very few programs highlighted the notion of critical literacy or multiple literacies as a vehicle for drawing on the already-present literacy (Marciano and Watson, 2021) assets of families of color.

Among the challenges reflected across international programs is low involvement of fathers in the literacy structures and supports provided, observation that the investment of grandparents appeared to be crucial to potential success, realization that adolescents tended to have difficulty with and thus, failed to secure tremendous benefits from the programs, and the recognition that multilingualism requires teaching language before family literacy content can be taught (UNESCO, 2008).

Based on these indications, key criteria for family literacy programs should involve the provision of training for teachers carrying out the family literacy programs with parent involvement. In addition, evaluation must be built into programs from their inception with a focus on qualitative and/or quantitative research as well as a shift to comparative studies across programs where findings are presented in multimodal and attractive formats for all stakeholders involved (UNESCO, 2008). This recommendation for evaluation of family literacy programs mirrors the call by Doyle (2012) for “thoughtful approaches to evaluation that consider the relations between program design features and program effects ... to provide the evidence necessary for maintaining funding support, [and] also to ensure that program participation yields optimal results for participating families” (p. 98). The call remains critical given that intervention/prevention and adaptation approaches also appear to be visible in family literacy programs that cater primarily to families of color across the globe, as they also were for families in the United States.

Table 1 Family literacy programs across the globe.

Africa				
Mali	Namibia	Senegal	South Africa	Uganda
• Support for the Quality and Equity of Education in Mali (Appui à l'amélioration de la Qualité et de l'Égalité de l'Éducation/AQEE) program (2003–2008), training and support to 700 parent associations and school management community-based organizations • The adult literacy program, Sanmogoya, functioning as part of this initiative was active in six regions of Mali (Timbuktu, Gao, Kidal, Koulikoro, Sikasso). • There, approximately 6000 adult learners benefitted from the services provided by 140 literacy centers. • The course was divided into two phases—basic literacy and post-literacy based on sound theories of reading and writing—and is taught by volunteer teachers drawn from the community. • The Parent Association in each community managed the program with training and support from the local NGOs.	• A study was conducted in a school in each of the thirteen regions to launch the family literacy program to establish what school principals, teachers, children and their parents (caregivers) believed to be the ways in which parents support their children in the 1st year of primary school • Next step in the implementation of the family literacy program was the training of family literacy promoters or facilitators. • Training of these promoters or facilitators. • Training of these promoters based on Ministry of Education document, “The First Teacher” and based on the skills and competencies expected from learners in the 1st year of school. • The main purpose of the training was to equip the promoters with an understanding of the importance of the role of the parents and caregivers in the development of early literacy skills in their children. This included early childhood development, storytelling and reading, songs and music, child protection, children's rights, HIV/AIDS and nutrition. In addition, sessions were designed to develop skills in facilitating groups and designing and writing session outlines. • Also, in Namibia, was the Adult Education program. The Ministry of Education recognized the high drop-out rates in Namibia and responded to this challenge by focusing on the problem of literacy in the home environment. In 2005, a carefully selected Family Literacy Promoters and Education Officers from the Head Office received a 10-week training program which allowed them to target 1281 parents with children in pre-school and in grade one	• The Grandmother Project (GMP) produced a booklet, entitled “The Role of Grandmothers in Halpular Society” to highlight the vital role that grandmothers play in the lives of children and their families. It was developed for use in both primary schools and adult literacy classes in southern Senegal. • The booklet and its dissemination to primary schools and adult literacy classes has served as a tool for teachers to bridge the gap between school and home by promoting discussion of cultural roles, values, and traditions. • Tostan, a non-government organization based in Senegal, realized that a successful program for helping women to transform their lives meant rethinking traditional educational approaches to better respond to participants' needs, habit, lifestyle, and culture • Tostan also felt it was essential to create program content and strategies to improve communication, understanding, and collaborative action for positive change.	• The Family Literacy Project (FLP), based in the KwaZulu-Natal province of South Africa, was started in 2000 to address the low literacy achievement of many pre- and primary school children. • The program also focused attention on parents who demonstrated low confidence in their ability to provide support for these children. In the program, eleven facilitators worked directly with 197 adults, 479 primary school children and 116 teenagers. • FLP group members visited neighbors to share information on early childhood health and development. • They also played with the children and read to them. • In spite of this progress, relevant reading materials were scarce and led to low levels of literacy for both children and adults. • Three community libraries, ran by the project, helped to address these concerns.	• Uganda's “Literacy and Adult Basic Education (LABE)” was developed when the country first reflected interest in family literacy. • The piloted program (2000–2001) supported parents and teachers in the Buguri district—one of the poorest districts in Uganda with low adult literacy rates. • LABE expanded the coverage of the pilot project from 3 to 18 schools. Eventually, the project catered to 1400 parents and over 3300 children. • And nationally, the African Family Literacy Action Group (AFLAG), founded after the November 2007 UNESCO Institute for Lifelong Learning (UIL), is a group which aims to implement a Center for Family Literacy in Africa which can function as a point of reference for promoting family literacy and disseminating tools and know-how across the continent.

Arab initiatives

Palestine

- The “Mother-to-Mother Program” in Palestinian communities has supported and strengthened the parenting skills of young mothers and trained mothers as paraprofessionals.
- The Learn-by-Play Program attempted to reverse the trend of increasing drop-out rates in elementary schools by building trusting relationships between pupils and teacher and creating a stimulating educational environment.

Bahrain and Saudi Arabia

- The “Mother-Child Home Education Program (MOCEP)” has provided a non-formal, home-based education program for pre-school-aged children and for their mothers.
- The annual 25-week program supported women who were provided with a schedule of daily lessons which they could use to teach their 5-year-old children at home.
- Like many of the family literacy program contexts targeted in the United States, participants (children entering primary school) were from low income, disadvantaged families, unable to afford pre-school education for their children.

Asia & Pacific

Vanuatu

- Vanuatu’s “Vanuatu Literacy Education Project (VANLEP)” has been coordinated in primary schools as an initiative focused on improving the literacy learning outcomes in rural and isolated areas of the country.
- VANLEP targets 8 and 9 year-old students in classes 3 and 4.
- Teacher training and teacher empowerment represented an important element of the program.
- Other objectives were to provide quality books for children, improve classroom management, and parent’s awareness with regard to literacy learning at home and participation in literacy acquisition at school.

National programming

- The “Manukau Family Literacy Project” which was based originally on the American Kennan model, eventually reflected the added component of Parent and Child Together Time.
- The model involved adults attending their children’s schools to participate in a program.
- Adults also enrolled in a course focused on child development and participated in the reading and numeracy components of their children’s schoolwork.

Europe

Hamburg

Malta

Romania

France

Greece

- The FLY pilot project was implemented in 2004 with participation of parents of 5-year-old pre-school children and runs in nine locations in socially disadvantage districts of Hamburg.
- This program aimed to involve parents in everyday school life with a focus on literacy activities.
- Individuals worked with parents within the pre-school/day centers and their support focused on three major components-keeping parents actively involved in everyday classroom activities (together with children), engaging in activities with parents independently of children, and engaging in parent and student activities outside of school.
- Beyond this, the “Foundation for Educational Services (FES)” in Malta was conceived as a means of providing a range of innovative educational initiatives a range of innovative educational initiatives with a focus on literacy support, parental empowerment and lifelong learning. The program involved after-school family-oriented educational service, complementing and reinforcing teaching and learning at day schools.
- In addition, Romania’s “Center Education 2000+ (CEDU)” focused on “Parent Empowerment through Family Literacy (PEFaL),” a program that remains visible in a few schools and kindergartens.
- PEFaL functions as the only literacy program targeting parents and children equally in the country
- And “Mother Child Education Foundation (A.EV)” in Turkey functioned as a source of empowerment for people using education through the implementation of research as well as the development and implementation of programs in early childhood education and adult education, particularly targeting pre-school children and their families who were at a disadvantage.
- “Agence nationale de lutte contre l’illettrisme (The National Agency to Fight Illiteracy/ANLCI)” in France (2000) was launched to coordinate the efforts of all stakeholders and the resources provided by the State, local authorities and private enterprises towards advocacy and action in the field of literacy.
- ANLCI recently began a focus on family literacy and has actively promoted the approach in France.
- “Parents’ Schools” program (2003) was launched nationwide in the context of the country’s commitment to lifelong learning exist in all 14 prefectures with 45,000 (approximately 3500 fathers and 41,500 mothers) participating in these courses
- The courses offered through this program are mainly held in schools and community centers. The Parents’ Schools were run exclusively for parents, although parents were recruited through their children’s educational institutions.
- Like many programs in the United States, the focus of the Parents’ Schools is on parenting intergenerational communication, encouraging parents to participate in school activities and addressing the issues of violence and health.

National programming

- “Basic Skills Agency (1990+)” also a European program, was leveraged and reflected three strands: sessions for parents in which they worked on their own literacy and on how to help their children; parallel sessions for children in which they received high-quality early years provision for reading, writing and talking; and joint sessions in which the parents typically tried out something with their children that they had been practicing just beforehand in their separate session.
- Book start originated in the United Kingdom in 1992 and distributes Bookstar Baby packs which often have baby books and a flyer with information about engaging in shared book reading with infants. Over 3 million book packs have been distributed across the European Union, Asia, Australia, and New Zealand through the program (Book Trust, 2019).
- After the November 2007 UNESCO Institute for Lifelong Learning (UIL), France submitted a proposal for a national family literacy pilot program to the Ministry for Social Affairs. This has since been approved and was in the process of being launched.

North & Latin America

<i>Guatemala</i>	<i>Caribbean</i>	<i>Canada</i>	<i>USA</i>
• Guatemala launched the “National Committee on Literacy (CONALFA)” in 1998, a program featuring the idea that one member of the family, generally a child attending the 4th, 5th or 6th grade of primary school would provide teaching to adult members of his or her family unit, in most cases, this being the mother. • The primary objectives of the program were to assist the educational development of the individual within the home, without detracting from the culture or behavioral patterns that often held within the family environment, and to strengthen family relations by allocating responsibilities to all its members.	• Caribbean Community (CARICOM) spearheaded the Caribbean Action Plan for Early Childhood Care, Education and Development, approved by the Standing Committee of Ministers of Education in 1997. • Five years later, Caribbean leaders endorsed a regional action plan for the period 2002–2015 with Guidelines for Developing Policy, Regulation and Standards in Early Childhood Development Services. • OECS emphasized education and training for parents and caregivers of children of children (0–5) and appropriate education for the children (3–5). • The Foundation for the Development of Caribbean Children (FDCC) implemented the Roving Caregivers Program (RCP) to deliver family and community interventions, help create and apply knowledge, support advocacy and communication for development. • FDCC runs the Early Childhood Health Outreach (ECHO) to incorporate maternal and child health services into RCP (0–5). • FDCC supports the Family Learning Program, providing literacy and numeracy skills to parents. • FDCC’s Youth and Community Advocacy Network (YouCAN) mobilizes young people to get involved in the quest for high-quality ECD and family support programs.	• “Éduk”—an NGO working mainly in the area of literacy for the francophone minority in Canada developed and implemented literacy and family literacy programs and policies in response for the need for communities, families and individuals to be exposed to and use the minority language in order to gain mastery of both the minority and majority languages, practitioners are provided with a comprehensive five-day program on the foundations of family literacy in French and English. • The French-language family literacy programs help parents transmit mother tongue skills and develop a sense of belonging to a specific culture.	• The “National Center for Family Literacy (NCFL)” in the USA reports 5000 family literacy programs operating in non-governmental organizations (NGOs), schools, libraries, and early childhood centers. • NCFL provided a model demonstration of best practices. Provided training for more than 150,000 teachers and program administrators, advocates for family literacy in the US Congress and state governments, and conducted research and evaluation to increase the knowledge base and improve the quality of programs as they continue to emerge.

Global programs & conferences

- In 2004, UIL launched family literacy pilot project (FLY) in Hamburg inspired by the family literacy programs developed by the Basic Skills Agency (BSA) in the UK and from 2005 to 2007, UIL coordinated a European project on family literacy—QualiFLY (Quality in Family Literacy)—which was funded by the European Union through the Socrates/Grundtvig program and included partners from around the world.
- Family literacy has remained a focus of UNESCO’s series of Regional Conferences in Support of Global Literacy in the context of Education for All (EFA) and the United Nations.

Culturally relevant literacies of families of color

As has been shown, family literacy programs both in the US and across the globe, were from the inception, developed with the child in mind, overlooking the parent and privileging school-based literacies. Even with certain advancements in and beyond the US that cater to adults, the centering of the literacies of families of color and the equal focus on culturally relevant literacies geared toward both parent and child remain a laudable goal. To address this dynamic, family literacy programs must get to know families of color and understand the literacies that they already possess. Research findings presented below, though not exhaustive, have informed our understanding of how discourse and dialog within families of color influence children's language and literacy learning as well as how distinctive family patterns and literacies can be, even among families living in similar circumstances or locations, as well as those migrating across contexts (e.g., Compton-Lilly et al., 2012; Desmond and Elfert, 2008; Edwards and White, 2018; Heath, 1983; Li, 2000; Moll et al., 1992a,b; Smith and Marfo, 2015; Smith, 2019; Taylor, 1983; Velliaris, 2015).

Ethnographic studies

As alluded to earlier, in her detailed ethnological study of families in North Carolina, Shirley Brice Heath (1983) examined the literacy practices of three communities in the Carolina Piedmonts and found the ways that White, middle-class families used literacy at home were most strongly associated with the forms of literacy taught in school. Consequently, these children tended to succeed in school. However, the literacy practices of African American middle-class and working-class communities at home differed from the forms of literacy valued and taught in school. These children were less successful in school. Heath intended to demonstrate the need for more diverse and inclusive literacy teaching strategies in schools. Her observations about the use of oral language and print among all three groups of children and their communities provided one of the most nuanced documentations of cultural differences related to language and literacy and how these differences influenced children's performance in school.

Similarly, Luis Moll has coined the term "funds of knowledge" (FoK) to refer to practices in the household including those involving labor and socialization that are located at the center of learning interactions between children and adults, accessible through the ethnographic home visits of teachers and researchers (Moll et al., 1992a,b). Extending beyond the households of families of color to their life worlds, researchers have identified FoK across a range of contexts from family values and beliefs to popular culture, interests, content areas, communities and classrooms (Bouillion and Gomez, 2001; Moje et al., 2004; Razfar et al., 2015; Riojas-Cortez and Flores, 2009; Smythe and Toohey, 2009). For families of color, examining the FoK consisting of knowledge and skills accumulated culturally and historically allows teachers to incorporate literacies from their life-worlds to support their well-being, provide a context for more traditional literacy learning and also, interrupt institutional norms that privilege certain literacies over others (Flores, 2020; Moll et al., 1992a,b, 2005; Razfar et al., 2015; Rosa and Flores, 2017). Mirroring the focus of family literacy from its inception, children of color "are not passive bystanders, as they seem in the classrooms, but active participants" (Moll, 2005, p. 74).

Li (2000) has illustrated how families of color each live "their own literate lives in their own way" (p. 27). In her ethnographic examination of an immigrant Filipino family in Canada, Li (2000) illustrated how individuals function both within and out of ethnic groups to develop identities that may or may not mirror the typical depiction of this group. Through the ideologies and power relationships that individuals in the family aligned with based on their socialization in the family as well as the school and broader society, Li has shown how discourses work in families of color to align with corresponding social and how family literacy practices can therefore be very complex and different from what is often typically expected by society.

And Smith (2019) has highlighted how a Black adolescent immigrant youth, Jaeda, navigated literate and racialized linguistic discourse with her mother and sister in a single-parent family while also engaging the racialized discourses of peers and teachers in schools. Examining the literate uses of Englishes and its corresponding raciolinguistic ideologies (Rosa and Flores, 2017) leveraged by this adolescent in her linguistic and literate interactions with her mother over time even as she transitioned across Jamaica and the United States, Smith (2019) illustrated how Jaeda, in this single-parent family, made use of "metalinguistic, metaracial, and metacultural understanding of her past experiences with race and language, and by extension, culture, to determine how to function effectively within non/academic settings in ways that [did] not completely sacrifice her personhood" (pp. 299–300).

Through multiracial understanding, Jaeda focused on her thoughts about race, including how the racialization and social constitution of Englishes and other languages, allowed her to exercise duality while retaining her personhood. Through metalinguistic understanding, she focused on thinking regarding her thoughts about language, developing awareness and control of the linguistic elements that she used, including understanding how and why Englishes and other languages are flexibly used for different purposes. Through metacultural understanding, she acknowledged how her race and racialized Englishes as a Caribbean youth were both associated with, yet transcended typical conceptions of these constructs in the cultural context of the US. Presenting how these intersecting forms of understanding functioned in Jaeda's literate discourse, Smith (2019) demonstrated how the adolescent adopted "a transraciolinguistic approach," using her past experiences with race and language, and by extension, culture, to agentively exercise flexibility and duality in response to racialization.

Programmatic tensions

As discourse, family literacy is inclusive of the oral and written communications within the family and it encompasses the family's efforts to support the language and literacy development of their children. Indeed, it is this definition that often puts some

professionals at odds with others, as some wish to keep a focus on interactions that are unique to the family, while others see the need for skill development essential for success in educational and workplace settings. This bind is noted by Faircloth and Thompson (2012) as they discuss the tension between the traditional literacy practices in Native American families in contrast to literacy skills needed for education and economic success. Similarly, Scott et al. (2012) stress the need to be inclusive of family beliefs and values when considering services to families. And Smith and Marfo (2015) highlight the need for closer attention to linguistic diversity of children in early childhood care and education settings, critical to emergent learners' academic progress, socioemotional development (Bauer, 2000; Bauer and Arazi, 2011; Siegel, 2012) and social, emotional, academic, and cultural skills (Dickinson et al., 2006; Strickland and Morrow, 1989; Tomasello, 1999). Using oral traditions and cultural heritage of families can provide a creative and empowering means of helping families develop reading and writing skills important for many everyday functions, and can potentially serve as a foundation for more advanced literacy development (e.g., Adra, 2004).

On a broader level, the literacy skills of families of color are central to the literacy proficiency of neighborhoods and communities; viewed collectively, they determine the literacy levels of individual countries around the world. That the family is instrumental in these highly significant international phenomena is no surprise, given the extensive documentation of the correspondence between parental literacy levels and children's literacy skills. Other social organizations, especially schools, certainly carry a significant responsibility for producing a literate society, but they can accomplish their mission better when families are able to provide children with a firm foundation in language and early literacy prior to school entrance. Because some families may lack the skills or knowledge to help their children succeed in school and later employment, many societies have provided services to help ensure that not only children but also the adults have opportunities to gain these skills (UNESCO, 2008, 2019). The UNESCO Institute for Lifelong Learning (UIL), partnering with national and local partners in countries within Africa and South Asia, with predominantly populations of color, reflects how societies such as those in Benin, Burkina Faso, Ethiopia, the Gambia, Guinea-Bissau, Guinée, Mali, Niger, Senegal, and Pakistan, in 2019, has used workshops to build capacity for communities of color in family literacy and learning (UNESCO, 2019).

Family "literacies" vs. school-valued literacy

As observed in our discussion of family literacy both in the US and across the globe, there continues to be an emphasis on enhancing the livelihoods of parents and families, but it is unclear the degree to which culturally relevant literacies that draw upon the already-present literacies, cultural practices and community wealth, play a key role in designing and transforming literacy curriculum to align with the needs identified by large numbers of culturally, racially, and linguistically diverse families across the globe. Many teachers judge students' literacy practices according to their own background experiences and mainstream expectations of how print can be used. They view their own mainstream literacy practices as "right," and "legitimate" and not in the context of power relationships within a socially and racially stratified society. And they identify literate practice as the kind that is valued within schools. Most teachers typically consider activities such as mastering the alphabet, reading books, or writing essays as literate practices. However, literate practices are much more complicated, extensive, and deeply embedded in culture. For instance, there are literate practices associated with Hip Hop culture that are not legitimized in school, but nonetheless involve sophisticated use of language (Morrell and Duncan-Andrade, 2002). Considering multiple literacies as an avenue for reconsidering the role of school-valued literacies may present a pathway for using mechanisms such as parent stories to address this concern (Edwards et al., 1999, 2019; Ellison and Solomon, 2019).

Literacy instruction is more effective when it honors the ways of using language and print presented by students of color, insights made possible through the stories of parents. A social equity orientation supports the view that *schools and teachers* need to recognize the literacies that children bring from home so that we can build upon what they know and do in the classroom (Lazar et al., 2012). Beyond this, we believe the insights from our discussion point to the need for re-envisioning the conception of family literacy, which we subsequently propose.

Parent stories

Parent stories (Edwards et al., 1999) are windows into the lives of children and their families and be seen as repositories of information about literacies within homes and communities as well as the "funds of knowledge" (Gonzalez et al., 2005) that are contained in households. Collecting parent stories provide a way to gather information about students' home and community valued literacy practices (Edwards et al., 1999). Teachers can generate parent stories through thoughtful questioning and dialog with caregivers. Several teachers have shared with Edwards that they viewed parent stories as a tool to gain insight into students' current academic performance as well as their potential. Teachers also shared that parent stories helped them to better understand their students' literate lives outside of the school context. Some of the questions that teachers have asked from the Edwards-Pleasant Parent Stories Questionnaire (1999) include:

- Can you describe "something" about your home learning environment that you feel might be different from the learning environment of the school? (p. 40)
- Can you describe "something" about your home learning environment that you would like the school to build upon because you feel that this "something" would enhance your child's learning potential at school? (p. 40)

- Is there “something” about your child that might not be obvious to the teacher, but might positively or negatively affect his/her performance in school if the teacher knew? If so, what would that “something” be? (p. 38)
- Everyone has hopes and dreams when they are young children. As a child, what did you want to be when you grew up? Did that change over the years? Have you realized your childhood goals for your future? (p. 39)

A collection of parent stories can serve as a space for shaping and impacting teachers’ knowledge and beliefs about how to connect students’ language and literacy experiences valued in their homes and communities with formal school valued literacy practices. This connection might interrupt deficit ways of thinking and put us on the path toward more inclusive models for working with nonmainstream children and families of color.

Re-envisioning family literacy for families of color

Given the foregoing discussion, we envision family literacy for families of color in the 21st century as multifaceted. Family literacy has come to embody the multiple and critical literacies that parents and children use to intergenerationally interact and sustain their cultural, linguistic, and racial identities across home, school, and the globe while mastering and manipulating school valued literacies for agency to determine how they can best thrive in society and create social change. In such a definition, family literacy is concerned with “culturally relevant” and “culturally sustaining” mechanisms that address the “multiplicities of identities and cultures that help formulate today’s youth culture” (Ladson-Billings, 2014, p. 82; see also Paris, 2012) as well as drawing on the “already-present literacies” (Marciano and Watson, 2021) in the “within-group” and “across group” cultural practices necessary for cultural competence (Paris, 2012, p. 95) and a sense of agency. At the same time, family literacy is concerned with supporting parents and their children, both independently and collaboratively, to master and manipulate school-valued literacies in ways that align with their culturally, linguistically, and racially diverse identities while supporting their sense of agency for thriving within and across culturally diverse communities for socially transforming the world. In contrast to a focus on building traditional literacy skills for problem-solving, a contemporary definition of family literacy for families of color moves toward identifying the literate assets that children and parents agentively possess based on how they already interact culturally within their communities and uses this as a basis for determining how school valued literacies might be taught and leveraged in ways that extend their communicative literate repertoires.

We believe such an approach necessitates a shift from family literacy to what we envision as “*family literacies*,” a notion that “disrupt[s] practical [and static] notions of what it means for ... [families] to reflect success in literacy” by acknowledging how literacy practices based on school-valued literacies often reflect “schizophrenic institutional norms that delegitimize [the] personhood, linguistic repertoires, and literacies” of underserved populations and “[create] potential challenges for their wellbeing” even while claiming to equip them with literacy skills (Smith et al., 2020). With this contemporary definition, we invite the transition from the notion of family literacy that emphasizes code-, employment-based and life-skills of families for aligning with pre-existing needs of society to a vision of “*family literacies*” that instead serves as a vehicle for empowerment and agency based on the cultural, racial, and linguistic wealth of communities as well as the desires of families of color for social change.

Considerations for family literacy programs for families of color

Based on the above, it is clear that transitioning toward *family literacies* for families of color will require a rethinking of the current ways in which approaches are leveraged, particularly in early childhood contexts. There is also a need for foregrounding children’s literature and its many facets as a basis for developing and evaluating quality approaches to family literacies for racially, linguistically, and culturally diverse communities.

Reconceptualizing family literacies in early childhood development

Drawing from Smith and Marfo (2015), we recommend, much like “parent stories” (Edwards et al., 1999), envisioning *family literacies* as part of contemporary holistic conceptualizations of early childhood development that move away from traditional notions by finding out from caregivers what is needed by those in the early childhood sector here and now. Beyond this, we envision *family literacies* as an indispensable element of all aspects of “early childhood development,” where this development is holistic in nature and that allows for a centralization of administrators who interact with each other around how to consolidate delivery services in regard to linguistic, health, racial, social, emotional, cultural, etc. As observed by Smith and Marfo (2015), “the construct of early childhood development (ECD) provides a much broader umbrella framework for bringing together all dimensions of children’s health, language, development, protection, and well-being into a system of policy-driven intervention services with preventive, facilitative, and ameliorative objectives” (p. 41).

Such a system does not have to consolidate all sector-based early childhood services under one bureaucratic organizational structure or management; rather, it will serve to provide an overarching integrative synergy that brings much-needed national coherence to policy formulation and execution and in the process, strengthens sector-based programs. In doing so, literacy, or rather “*literacies*,” would form a basis for this integrative synergy. There are literacies undergirding language, literacies undergirding health, literacies undergirding development, literacies undergirding well-being. In this proposed approach, literacies within and across each

of these sectors would be identified based on examinations of the at-risk populations in question with particular attention to race, language, culture, gender, class, nationality, etc.

The literacy curricular then, contrary to what it tends to be at the moment where traditional approaches to family literacy limit educational foci to constrained skills such as concepts of print, the alphabet, phonics, phonemic awareness, etc. (Paris, 2005) would expand significantly to include literacies that are useful for daily living, thriving, agency and survival. By the same token, family literacy programs would extend beyond traditional literacy skills and be re-examined and re-envisioned to reflect elements such as critical literacy (Bacon, 2017; Luke, 2012), anti-racism (e.g., Smith, In review; Willis & Smith, In review), and a transraciolinguistic approach (Smith, 2019). For instance, integrating mechanisms such as a transraciolinguistic approach into family literacies can facilitate the use of metalinguistic, metacultural and metaracial understanding in family literacy programs, allowing teachers as well as parents to rethink how skills such as phonemic awareness can penalize students' dialectal production because their language is racialized in literacy classrooms (Smith, 2019, 2022; Smith et al., 2020).

An early childhood development system that centers *family literacies* would replace the fragmented system often seen with family literacy practices that tend to operate often independently of "early childhood care and education" by placing "education" in one locale of the government or society and other elements such as "health" in another. As Smith and Marfo (2015) have explained:

While we acknowledge, though, that coordinating disparate services through a liaison agency is certainly one way to conceptualize integration, what we have in mind here are realistic, flexible, and dynamic cross-sector planning and coordination strategies that make it possible to structure and manage new and existing programs/services—around space, time, and distance—to ensure that for any child (and family), any number needed intervention components will be readily accessible in closeness, proximity to the community of residence (p. 41).

A re-envisioned and re-imagined notion of *family literacies* for families of color would thus emerge from, as well as cater to, the unique literacies of at-risk populations, which in turn, can function as a basis for caregivers, educators, healthcare providers, working in tandem to develop a holistic child. Equity can only be achieved when the assets that at-risk populations bring are used as a basis for building on their already established and prioritized knowledge bases about the world and survival in ways that they can find usefulness. Such an approach would foster redesigned literacy curriculum for parents and children that extends beyond the traditional sense and enables them to use their literacies to navigate multiple layers of success in an increasingly complex society. It would also challenge us to redesign traditional literacy curriculum and standards in ways that center anti-racist policies and practices during instruction. *The question then becomes, "What literacies can be incorporated into and across family literacy programs in ways that build upon the already-present literacies that families of color possess and the agency that they wish to use for social change in and beyond their communities?"*

Leveraging equitable literacy practices in family literacy for families of color

Incorporating children's literature that reflects the cultural norms, histories, and experiences of families of color is one way in which to build literacies into family literacy programs and tap into the already-present literacies they possess. Books written by and about people of color can provide opportunities for children of color to access their background knowledge which aids the comprehension of text. For example, Bell and Clark (1998) conducted an experimental study with African American children in grades 1–4 and found that "comprehension was significantly more efficient for stories depicting both black imagery and culturally related themes than for stories depicting both white imagery and culturally distant themes" (p. 470). A focus on literature written by and about people of color also provides opportunities for children of color and their families to see themselves represented in ways that are authentic—thereby allowing books to function not solely as windows, but also as mirrors for them (Bishop, 1990). Bishop (1990) writes:

Books are sometimes windows, offering views of worlds that may be real or imagined, familiar or strange. These windows are also sliding glass doors, and readers have only to walk through in imagination to become part of whatever world has been created or recreated by the author. When lighting conditions are just right, however, a window can also be a mirror. Literature transforms human experience and reflects it back to us, and in that reflection we can see our own lives and experiences as part of the larger human experience. Reading, then, becomes a means of self-affirmation, and readers often seek their mirrors in books (p. ix).

For children and families of color, oftentimes books function as windows and less as mirrors. In her book, *Telling Tales: The Pedagogy and Promise of African American Literature for Youth*, Johnson (1990) writes, "We use children's books as agents of socialization, politicization, and of formal education" (p. 1). Children of color may miss out on important underlying messages when they are deprived of opportunities to read books written by and about people of color. Johnson (1990) contends that African American children's literature "at its foundation demonstrates an abiding concern for the psychological, pedagogical, esthetic, intellectual, and spiritual needs of African American youth" (p. 3). This body of literature has underlying themes that are important for African American youth such as an emphasis on Black history, battling racial injustice, and race pride.

Many of these underlying themes were delineated by W.E.B. Du Bois, Jessie Redmon Fauset, and Augustus Granville Dill, the creators of the *Brownies' Book Magazine* (1920–1921)—one of the first periodicals created primarily for African American children. Du Bois (1919) articulated several objectives he wanted to accomplish with this magazine. A few of them were "To make colored children realize that being colored is a normal, beautiful thing," "To make them familiar with the history and achievements of the Negro race" and "To make them know that other colored children have grown into useful, famous persons" (p. 286). These themes continue to be of significance and are addressed in the works of many contemporary African American authors (McNair, 2008).

In spite of the importance of children of color seeing themselves in books, statistics published by the Cooperative Center for Children's Books show that there are significantly fewer books published by authors of color annually (CCBC, 2020). However, there are still a significant number when considering titles that have been published over the last 30 years. McNair (2015) completed a project with 10 African American families—with children in grades K-2—in which each family was provided with more than 50 children's books written by and about African Americans. There were a series of monthly 2 h workshops (from March until July) at which each family could select 10 books. The purpose of McNair's project was to examine what happened when these families were exposed to an abundance of books written by and about African Americans. Findings suggested that parents increased the amount of time reading aloud to their children, passed along the information they learned about African American children's literature to family, friends, and co-workers, and began seeking out and developing an appreciation for quality African American children's literature.

McNair (2015) provided families with information about notable African American authors and illustrators so they could seek out titles by these individuals at local bookstores or libraries and make requests that they be made available for purchase or to check out if unavailable. The project ended with a presentation by James E. Ransome, an award-winning illustrator of notable titles such as *Uncle Jed's Barbershop* (Mitchell, 1993), *Aunt Flossie's Hats (and Crab Cakes Later)* (Howard, 1991), and *Visiting Day* (Woodson, 2002). McNair shared titles across multiple genres (e.g., fantasy, historical fiction, contemporary realistic fiction) that included "classics" such as *Everett Anderson's Goodbye* (Clifton, 1983) and *Flossie and the Fox* (McKissack, 1986). Components of this program included high-quality children's books written by and about African Americans, culturally relevant materials such as dolls and "people colors" crayons and pencils, and instruction for parents on activities such as how to conduct interactive read alouds and have children respond in various modes such as art and writing. Equally important as well was the welcome inclusion of the entire family (and extended members such as grandparents) in the workshops. This was key in that grandparents who are often caregivers can be instrumental in the literacy development of children.

Providing children and their families with access to digital books is necessary with the increasing usage of technological devices such as iPhones. Epic, for example, is a free digital reading platform with more than 40,000 titles from 250 plus publishers. A perusal of this platform reveals picturebooks and transitional chapters books written by and about African Americans authors such as Nikki Grimes. Digital access can make it easier for children who may come from lower income families to read books. Last, sharing children's books in settings outside of the US featuring children of color can be insightful as well. For example, for African American children, allowing them to see representations of the Black experience set outside of the US can raise their sense of global awareness. Titles such as *The Field* (Paul, 2018), a story of young children playing soccer on the Caribbean island of Saint Lucia, can help children recognize the complexity and variety within the Black experience.

Conclusion

Nelson Mandela stated that "education is the most powerful weapon which you can use to change the world." We concur. As the foundation of education, literacy is important. It is a global affair. In this chapter, we have indicated that a key element missing from many approaches to family literacy for families of color is the use of the cultural assets possessed by these communities as a vehicle for empowerment and social change. We have illustrated how multiple literacies can function as a basis for valuing the funds of knowledge that families of color possess while also allowing them to develop agency surrounding their futures and the changes they wish to see in their communities. We have argued, based on notions of culturally relevant literacy, for a shift in conception and in practice, from family literacy to *family literacies*.

As Kofi Annan seventh Secretary-General of the United Nations, has rightly indicated:

Literacy is a bridge from misery to hope. It is a tool for daily life in modern society—For everyone, everywhere, literacy is along with education in general, a basic human right—Literacy is, finally, the road to human progress and the means through which every man, woman and child can realize his or her full potential.

For families of color in the United States and across the globe, we envision that family literacy programs will be re-envisioned to center culturally relevant literacies that empower children, their parents and communities, to create and enact social change.

Introduction

Literacy and identity across home, school, church, and social life is an important area of study which we have researched extensively. This encyclopedia entry presents the authors' research on various literacies grounded in sociocultural theories of learning and development (Vygotsky, 1978) and using qualitative methods. In particular, we discuss scholarship that is informed by language socialization (Ochs, 1995), New Literacy Studies (NLS) (Street, 1998), as well as theories of language, literacy, and identity (Ibrahim, 2016). An interdisciplinary perspective is key to understanding the experiences of students who move across and negotiate varied and multiple literacies in their daily lives.

As teacher educators who were formerly bilingual teachers, we center our studies on bi/multilingual children, adolescents, and adults in key cultural contexts. Our ways of viewing the literacy practices in these settings are informed by key scholarship on various literacies including home, non-mainstream, church, in-school contexts which we present in the literature review section. First, though, we discuss the overarching theoretical framework that informs our scholarship.

Theoretical framework: sociocultural theories of learning and development

Rooted in Vygotskian principles of learning and development, sociocultural theory provides a lens that illuminates how social and cultural factors affect literacy learning. The theory's focus on learning as a socially mediated activity and its view of language as the preeminent meaning making tool links mind, language, and society (Vygotsky, 1978). By using language as both a resource and a tool, individuals acquire knowledge in contexts that are culturally and socially organized. Cultural tools mediate novices' (both children and adults) becoming competent members of the various and diverse settings and cultural groups that make-up their daily lives. Thus, individual experiences are connected to social relations and individuals are linked to daily interactions and situated practices. Hence, the theory emphasizes the relationship between the individual and their communities. This overarching theory also affords a lens for examining literacy and identity. The Language Socialization (LS) paradigm deepens the view of language as a cultural tool for mediating learning and development, and for constructing identities.

Language socialization (LS) and identities

According to LS, children's acquisition of culture occurs in interaction with more expert members; language is at the center of this process (Ochs and Schieffelin, 1995). Through language socialization children gain an understanding of the social and cultural organization of their everyday lives, including knowledge, skills, values, beliefs, and social structures as they participate in language

and literacy activities. Hence, children are socialized through the use of language and literacy and to use language and literacy. The LS perspective looks at the role of social identity in the process of becoming a competent member of a community (Capps, 1999). In the socialization process, expert members of social groups use language to socialize children and novices to particular identities and roles which these children learn to express by using language in certain ways as they participate in complex social and linguistic interactions including literacy practices.

The LS perspective on identity differs from notions that are rooted in traditional psychological perspectives in significant ways. Language socialization acknowledges sociocultural factors and the diversity of forms in which development occurs and thus counters a collective and stereotypical identity for culturally and linguistically diverse students. What a child does and says and what others do and say to and around a child must be considered if we are to understand how identity is constructed. Language, then, is central to the construction of identity. Sociolinguists posit that “[s]ocial identity and ethnicity are in large part established and maintained through language” (Gumperz and Cook-Gumperz, 1982, p. 7). Moreover, LS’s particular view of identity/ies as being dynamic, fluid, and emerging in social interactions moves away from traditional psychological notions of identity as being static, rigid, and occurring solely within the individual—a move which affords a better lens with which to study the complicated situation of culturally and linguistically diverse (CLD) students whose identities may be context specific. Thus, children are socialized into social identities through discourse as scholars in New Literacy Studies (NLS) have pointed out.

New literacy studies

The turn of the century marked a shift in how literacy was understood beyond psychoanalytic lenses and the dichotomy between literate and nonliterate abilities of literacy. New Literacy Studies (NLS) originated from the confluence of various fields of discipline (Barton and Hamilton, 2012; Heath, 1983; Scribner and Cole, 1981) that sought to understand traditional thought and its relationship between literacy and cognitive development. Literacy, as defined by NLS (Gee, 2015; Street, 1984, 2003) considers the social contexts that inform literacy events and practices. Whereas the traditional view of literacy defines it as the ability to read and write, NLS situates literacy within a social perspective, challenging views that make invisible the social implications of literacy learning. Theorists who have made efforts to dichotomize literacy into oral and written discourse, approach literacy as autonomous, devoid of social influences, and characterized by cognitive skills (Hatch, 2002; Hymes, 1978). It is a view dominated by Western perspectives of what it means to be literate, often as a set of universal skills independent of social practices and their contexts. Further, the autonomous model is often associated with literacy programs and campaigns that often associate the acquisition of literacy with progress, civilization, individual liberty, and social mobility (Street, 2014). Byrd, Hayes, and Turnipseed (2021) speak of the pervasiveness of the autonomous model in education practice and policy to affirm dominant cultural practices while devaluing others. These autonomous models, add Byrd et al., exist in systems that uphold oppressive structures that negate access to certain forms of capital to culturally and linguistically diverse students. In contrast, NLS posits literacy as a socially constructed concept involving the intersections of power, beliefs, values, purposes, and economic and political factors. In this model, literacy is always embedded within the social institutions that define and practice the relationships of power and knowledge.

In line with Vygotskian notions of literacy, Gee (2015) constructs literacy within a sociocultural context arguing that language and literacy need to be studied in its social context, exceeding the limits of the traditional view of literacy studies. Therefore, Gee defines literacy in relation to Discourses. In his work on D/discourses, Gee proposes that language and literacy are more than just speaking, reading, and writing, but rather a part of a larger discourse that encompasses how literacy is valued, acted, transmitted, talked about, thought about, and believed to be. Gee’s work also analyzes what ideas, beliefs, and meanings are behind that language and extends the notion of D/discourses by claiming that we acquire a primary Discourse through our socialization with family and community. These Discourses are connected to a variety of literacies that are specific to that social context. On the other hand, secondary Discourses can only be learned in literacy settings that carry power. An example of such a setting is that of academic institutions and the learning that takes place behind those walls. By understanding the relationship between language and social and cultural contexts, we can also understand literacy through a sociocultural perspective.

Lastly the field of NLS also spawned the theory of *multiliteracies*. The theory of multiliteracies focuses on modes of representation that extend beyond print and written texts. An argument presented by the New London Group considers the “increasing multiplicity and integration of significant modes of meaning-making, where the textual is also related to the visual, the audio, the spatial, the behavioral, and so on” (Cazden et al., 1996, p. 64). The emphasis of modes as a channel for expressing meaning is what Kress (2010) terms multimodality. Multimodality describes the different communicative channels that include images, printed text, speech, color, and moving images. Scholars of multiliteracies do not limit their definitions of literacy to exclusively include print literacy, instead they expand on a broader definition that works to privilege multiple literacies evident in communities outside of schools (Perry, 2012). The implications of expanding the traditional notions of literacy through multiliteracies provide a greater opportunity for navigating a world that is constantly changing, thus placing demands on the ability to draw on multiple literacies. Through a sociocultural perspective, the production and consumption of digital texts becomes a new form of social practice that focuses attention on the way we engage in these literacy practices as members of some Discourse. If we consider Gee’s (2015) work on Discourses as described earlier in this section, then we can approach digital literacies as the language and literacy practices of discourse communities where members interact with text to redefine the meaning of literacy and to construct identities.

Literature review on literacy in multiple contexts

Home and community literacies

Rooted in a sociocultural paradigm, literacy practices are seen as highly contextual and diverse in specific settings. Through this lens, literacy becomes multiple and is shaped within the sociocultural and sociolinguistic contexts in which it is embedded (Schieffelin and Ochs, 1986). However, it is not enough to only study literacy in academic settings. For this reason, the literature in this section is representative of literacies across varying communities. The literature as it relates to the use of reading and writing outside of school is documented in ethnographies where local literacies are captured as people manage households, communicate with others, partake in leisure activities, and simply live their lives (Barton and Hamilton, 2012; Schieffelin and Ochs, 1986). Without a complete understanding of what people do with literacy in their everyday lives, misinterpretations can lead to disparities between varying sets of literacies. The need for this understanding lies in the scholarship that exists in out-of-school literacies.

Home literacies

Much of the deficit thinking on the achievement of culturally and linguistically diverse students like Latinas/os/xs stems from research that ignores and devalues their cultural strengths in favor of more dominant pedagogies (Gorski, 2006; Trueba, 1988). A response to these deficit views are those studies that aim to deconstruct thinking that fails to recognize the value of literacy outside of schools.

Much of what is missing in recent discussions of literacy is the reading and writing that exists beyond traditional texts. Prevailing conceptions emphasizing the relationship between literacy and print continues to place books as the only source of text. However, if we approach the term “text” through a sociocultural lens, then we can refer to Freire’s (1970) construct of the word as the ability to read the world and the word. In line with a more progressive view, Freire believes that one cannot read a text without situating the text in the context in which it finds itself. Almost simultaneously, the process of “reading” happens by understanding the text and its relationship to its social sphere. In this sense, the much-contested terms “text” and “reading” transform in meaning to encompass the analysis of gestures, moods, symbols, signs, and art. Text essentially becomes anything from which we can create meaning (New London Group, 2000). The studies in this section challenge the dominant notion that reading can only happen through books and highlight literacy as something more than what we learn at school.

Mui and Anderson (2008) take a sociocultural approach to study the literacy practices found in one Indo-Canadian family, consisting of a pair of older parents, their sons, and the sons’ families. As part of this multicultural dynamic, English and Punjabi were widely spoken. What Mui and Anderson found was that the Johar household contained a “rich tapestry” of literacy practices. Non-traditional literacies included the singing of Punjabi and English songs, especially at bedtime rather than the more dominant practice of reading bedtime stories. The literacy practices supported by the adults within a multicultural, multilingual context, uncovered the different pathways this family engaged in literacy.

A similar study that recognized the value of literacies occurring outside of school, was Johnson’s (2010) study of an African American family living in a small rural community in the southeastern United States. Informed by a sociocultural perspective of literacy, this study offered additional insight into the value that families assign to literacy by engaging in everyday tasks, religious services, and family events. The multiplicity of literacy found in the Jones family was unmistakable evidence that literacy is defined by the social context within which it is practiced (Perez, 2004). Within this family, literacy was used in multiple ways. Johnson describes seven ways in which the family is actively engaged in literacy: (a) interactional uses of literacy to build intra-relationships within the family such as letter-writing; (b) instrumental uses of literacy to perform everyday tasks such as cooking and sewing; (c) news-related uses of literacy to learn more about local and global events; (d) financial uses of literacy to organize their finances; (e) spiritual uses of literacy to attend to their spiritual lives; (f) recreational uses of literacy to entertain themselves; and (g) educational uses of literacy to support educational opportunities. This study helped to understand how one family’s practice and participation in literacy can shed light on the relationship between literacy and its historical and cultural context.

Research on Latina/o/x family literacy practices argues the importance of recognizing home literacies as valuable resources in literacy pedagogy. De la Piedra’s (2010) study of recent Mexican immigrant families living on the United States-Mexico border highlights the diversity of family literacy practices that included religious literacy and writing letters to family in Mexico to maintain relationships with relatives. The literacies practiced within the adolescent circles included sending emails, navigating the Internet to gather information about popular culture, and text messaging. The importance of the school-home connection is emphasized in this study as De la Piedra highlights how the young members of this family were able to engage in academic tasks when given the opportunity. This study also recognized that home literacies provide individuals with a set of literacies that can act as “funds of knowledge” (González et al., 2005) outside of the home.

Although everyday literacies are usually assigned a lower social value compared to more dominant literacies of schools and institutions, Mercado (2005) argues that “they are, in fact, hybrid practices that draw on the media and official literacies, as well as those household’s social networks” (p. 137). Mercado’s study of language and literacy in two Puerto Rican homes illustrates the value that literacy holds for these two families by describing how their literacy practices “are about making sense of and responding to lived experience” (p. 145). This study also concludes the importance of recognizing home literacies as funds that can help redefine what literacy learning means.

Research conducted on the literacy education of Latina/o/x adults is limited to the research on family literacy. Given this challenge, Rivera (2004) examines the experiences of Latina adults who participate in adult literacy education programs. In her study of Latinas in an adult literacy education class, Rivera challenges theories of “functional literacy” offered by proponents of adult literacy programs who only view literacy as a solution to the social and economic problems of larger cities. Through a popular curriculum where the learning content is connected to the real lives of learners, Rivera found that adult Latinas experienced a level of motivation to complete the program and foster community change. Her critique of the current focus on adult education for Latinas/os/xs, addresses the need to redefine the meaning and function of literacy as outlined by current adult literacy educational programs.

A seminal study in this area of family literacy research is Heath's (1983) work in the towns of Roadville and Trackton where class and racial factors were found to shape the literacy events found within those families. What she discovered was a discontinuity that existed between family literacies and the more dominant literacies valued in schools. Conceptions of literacy that are culturally based, such as those of the families in these two towns, have to recognize that literacy differs across communities and that not acknowledging such diversity contributes to the deficit views on home literacies.

As the studies in this section have shown, there is great significance in studying literacy outside of school. However, there is a greater challenge in acknowledging the significance of literacy practices within marginalized social groups. The following studies focus on a closer look at those literacies that exist within adolescent groups where much of their group activity is marked as diverging from mainstream standards.

Non-mainstream literacies

The following studies are centered around youth in non-mainstream communities to examine how the literacy and identity practices of these groups often go unrecognized in traditional literacy scholarship. Note that attention to these studies is not meant to glamorize any acts deemed unlawful. Nor do they diminish the negative implications involved in these acts. However, these studies do intend to create an understanding that adolescents engaged in unsanctioned social practices also engage in purposeful literate practices. As defined by Moje (2000), alternative or unsanctioned literacies include not only gang-related literacies such as tagging and graffiti, “but also a wide range of poetry, narrative, journal writing, letter writing, and novel reading” found in the literacy practices of most youth (p. 661). Moving beyond considering literacies of marginalized youth as representations of crime and resistance, Moje illustrates how unsanctioned literacy practices of these youth are in reality tools that not only transform thought and experience, but also make meaning about the everyday activities in their lives and shape these youth's identities. Her examination of five Vietnamese, Latina, Latino, Laotian, and Samoan participants' literacy practices was described in terms of three Discourses or the ways of “thinking, feeling, believing, valuing, and acting” (Gee, 2015, p. 161) that individuals use to create membership in a group: (1) written discourses such as the writing of raps, poetry, and parodies; the writing of gang names, street names, and/or gang symbols on notebooks, desks, walls, lockers, and as tattoos; (2) body discourses that included clothes and styles connected to a particular gang; and (3) oral discourses which include the accents, terminology, and dialects used in the gang. Moje (2000) found that tagging and graffiti practices were forms of literacy that became tools for transforming thought, identity, and power.

Alternative literacies mirror the current popular culture and practices of a given community. Although these practices are not novel in the lives of urban children and youth, they are part of a recent trend of research that frames these literacy practices from the perspective of the New Literacy Studies. The following studies research the multiple varieties of alternative literacies as illustrations of the uses of literacy that are specific to texts in given contexts.

Church literacies

A burgeoning body of work on children's and youth's religious learning highlights the church as a key site for literacy and construction of identities, particularly for culturally and linguistically diverse students. McMillon and Edwards' (2000) research on an African-American child who attended an African-American Baptist church found that he was seen as a “superstar” because of his participation in the Sunday school's literacy practices including recitation, retelling stories, and reading. On the other hand, his teachers in the public school considered him to be a child with behavior problems. A study of language and literacy socialization in a Catholic Church found that Latina/o/x immigrant children were socialized to a Mexican ethnic identity as they engaged in the literacy practices of their *doctrina* (catechism) class (Baquedano-López, 1997, 2004). Further highlighting the role of religion in the construction of identities for bi/multilingual students is Fader's (2001) research of a Hasidic community in New York. Fader found that the children's literacy experiences were differentiated by gender. Boys acquired literacy in liturgical Hebrew and Yiddish and studied religious texts all in Yiddish while girls were socialized to gendered roles through Yiddish and English language and literacy practices.

Hsin and Yu (2021) examined religious activities of Indigenous Taiwanese children involved in Catholic and Christian practices, as well as Indigenous ceremonies. Children negotiated their identities in the city and village due to the influence of varied religious practices. In the village, they formed their cultural identity through Rukai-related religious literacies but in the city, some children did not express their Rukai identity which may have been due to “limited access to Rukai linguistic and cultural resources” (Hsin and Yu, 2021, p. 331). Cun (2021) found how the use of religious texts at home created multilingual identities of Burmese refugee children in the United States. The families engaged in reading the Quran, praying, worship services in the mosque, and religious events with their parents. Through these religious literacies at home, children acquired Burmese, Arabic, and English.

Skerrett (2017) investigated how a Caribbean-Chinese child developed his religious identity through multiple language, religion, and cultural practices. The child developed a Christian identity influenced by the home and school setting, as well as the English dominant language. In another case study by Skerrett (2016), the religious identities and religious literacies of a Mexican American child were examined, along with the links the practices carried into the school social setting. The youth was constantly negotiating between her religious identities and literacies to those of her social setting. For example, “she reshaped her literate participation in secular contexts to better align with her religious identity” (Skerrett, 2016, p. 982) by no longer being a part of the hip-hop dance group at her school since she felt the lyrics of the song chosen to dance were not appropriate according to her Christian identity view.

Peñalva et al. (2014) examined transcultural spiritual literacy through artifactual mediations that were part of the cultural capital of a first-generation Latina child at a US church-affiliated community center. Change in identity was made evident as the child participated in transcultural navigations “through cultures, spiritualities, languages, and trajectories” (Peñalva et al., 2014, p. 101). When she shared the key holder as her artifact, the child also presented her rich literacies, such as using her artifact to tell a story, understanding Biblical information, and creating connections to her Honduran culture.

Children’s identity linked to writing during a Catholic First Communion preparation course was highlighted in a study by Tusting (2015). Children created Catholic identities through recontextualization of Catholic teaching that “highlighted the uniqueness of their individual biographies, supported them in verbalizing internal emotional experiences, highlighted their agency and their identity as active choosers, and situated them in relation to a particular set of broader communities” (Tusting, 2015, p. 238). Children were invited to reflect on their identity through texts and writing.

Poveda et al. (2006) examined how adults served as mediators for children in a Gitano Evangelist Church in Spain to learn how to interpret the Bible. Through outward and inward textuality orientations, students learn about authority, gender, and institutional roles depicted by the discussions of the readings from the religious texts. In another study, Rackley (2021) examined how Latter-day Saints youth engaged in religious literacies. Through observations during worship services and educational settings, Rackley found that motivation to learn about their faith was due to spiritual, relational, and educational factors. Additionally, demotivation in these areas were also recognized when there was a lack of influence and motivation. These motivations and de-motivations were linked to the identities youth constructed.

In-school literacies

Scholars have studied the contexts where children and adults participate in social and cultural practices to include the traditional classroom (Gutiérrez et al., 1995; 1997; Luke, 1994; Orellana, 1994; Rueda and Moll, 1994) and after school sites (Gutiérrez and Stone, 1997; Gutiérrez et al., 1999a; Vasquez, 2003). The schools exist as spaces where the rich family practices of the home can be leveraged for learning. An example of scholars that have created meaningful links between the children’s household practices and school social worlds is Moll and Greenberg (1992) who argue that by capitalizing on family and community resources, schools can improve instruction and serve more appropriately their diverse student populations, particularly second language learners. In this framework families and households are viewed as a source of knowledge and resources for curriculum design and classroom instruction. Moll and Greenberg (1992) employed ethnographic methods in the Southwest US to unveil the transmission of knowledge and resources among Latina/o/x households drawing from Velez-Ibañez (1983) early the concept, *funds of knowledge*. Scholars who focus culturally and linguistically diverse students have made clear the necessity of schools around the country to provide a more inclusive approach of their linguistic, literacy, and cultural strengths as resources during for learning (Fránquiz and Reyes, 1998; García, 2008; Jiménez, 2003; Mercado, 2005; Moll, 2005; Sánchez and Machado-Casas, 2009). Linking the knowledge from the home and community creates spaces where school age children can be positioned as writers and producers of knowledge in the classroom (Bauer and Gort, 2012; Jiménez, 2003; Moll et al., 2001; Reyes, 2006; de la Luz Reyes and Halcón, 2001). Vásquez craftily illustrated how children in the early grades possess the capacity to critically engage with texts and become critical readers (Vásquez, 2014). While studies illustrating how young bilingual learners are capable of sustaining literary conversations about or around texts (Martínez-Roldán, 2003) are scarce. Engaging with difficult topics such as discrimination, death, and patriarchy during interactive read alouds has been shown to be possible in the younger grades when carefully planned, managed and enacted (Lara and Leija, 2014; Lara and Fránquiz, 2015; Leija, 2017; Leija and Fránquiz, 2021).

Building on funds of knowledge and their use in the classroom, scholars have proposed an interrogation of the tools that mediate how identities are taken up, created and defined as funds of identity (Esteban-Guitart and Moll, 2014). These funds of identity are the accumulation of knowledge, interests, skills and artifacts that students collect throughout their lives in their home and community contexts to shape their identities (Esteban-Guitart, 2016). Fránquiz, Ortiz, and Lara make clear that while funds of knowledge are collected through ethnographic home visits, “the strategy for building up funds of identity requires opportunities to create and share identity artifacts in school and after-school contexts that allow teachers to identify skills, knowledge, significant people, and places to be linked to curricula” (Fránquiz et al., 2021, p. 406). Taking stock of students’ funds of identity allows for teachers to create spaces where students’ identities can be leveraged to make sense of texts in the classroom. Oikonomidoy and Karam (2020) illustrated how funds of identity can serve as a lens to how the family socialization practices contribute to children’s development of not just language but also their sense of agency and identity in the classroom.

Research which examines the hybrid language practices—that is, the strategic use of multiple codes and registers—of bilingual (English/Spanish) students includes studies of an elementary classroom (Gutiérrez et al., 1999b) and an after-school computer club (Gutiérrez et al., 1999a). These articles reframe the role of language in the classroom from the object of instruction to a tool for learning. Gutiérrez et al. (1999b) study of hybrid language practices in a dual immersion elementary classroom highlights the role of language in cognitive development, literacy learning and socialization. To illustrate the mediational importance of language, the authors focus on the development of one student in particular, Jorge. In this classroom, the teacher organized learning, so that Jorge could use his cultural and linguistic background and experiences as resources to further his own learning of literacy content. In affording Jorge, the opportunity to use his full linguistic “tool kit” (Gutiérrez et al., 1999a), Jorge’s identity was co-constructed as a “knowing contributor” (p. 300). Hence, because this class valued different ways of demonstrating competence, Jorge was able to reframe his identity from that of class clown to knowing contributor.

Gutiérrez et al. (1999b) demonstrate the importance of language as a central mediating tool in fostering the learning and socialization of Martha, a young third grade bilingual Latina in an afterschool club. In an exchange of email letters with El Maga (the cyberspace entity who presides over the computer club), Martha draws upon a repertoire of codes (English and Spanish) and registers to accomplish particular goals. In doing so, Martha is being socialized to the culture of Las Redes while at the same time, “El Maga and other adult participants of Las Redes are socialized to children’s linguistic, sociocultural, and academic experiences” (p. 20). Thus, in this case the socialization process is a bi-directional one which occurs through the use of multiple codes and registers.

Our research on literacy and identity

Our body of research focuses on the intersections of language, literacy, and identity in bilingual communities. We examine these processes within and across educational settings, both formal and informal, including schools, homes, and churches with the intent of bridging these spaces. In our research, we underscore how cultural contexts affect the language and literacy socialization of bilingual Chicana/o/x and Latina/o/x students in that these students engage in social practices that vary across settings and that influence their learning and identity formation in different ways.

Research on literacy and gender of Latino male teachers and their bilingual students

Dr. Lara’s research focuses on the language and literacy practices of Latino/a/x teachers and their students and how their identities are mediated by their reading. In addition, his research interrogates the relationships between discourse and identity. A particular focus is the incorporation of multicultural literature in the classroom. Through the interactions with texts, spaces are created in the literacy events to explore how literacies beyond that of the written text help all actors in the classroom mediate their identities across various contexts such as school, home and community.

Lara and Fránquiz’ study (2015) study of the introduction of bilingual literature with a focus on gender equity centered on an understudied population of Latino male elementary teachers. In a profession that is largely dominated by white women, Latino males make up less than two percent of the teaching population. This study investigated the intersection of gender and ethnicity of Latino male elementary teachers’ literacies and identities in bilingual classrooms through their narratives, experiences and pedagogical practices of read alouds. A qualitative multi-site case study of three Latino male teachers and their classrooms, the study employed qualitative methods and LatCrit as a theoretical lens as a way to depart from the white and Black binary of the studies preceding it. Latino men share common characteristics with the master narrative of male teachers yet; they live in a parallel world where they do not necessarily reap the benefits of hegemonic masculinity and male privilege. The study focused on three teachers who employed interactive read alouds in their bilingual education language arts lessons. Apart from traditional literacy, all three teachers had an explicit focus on critical literacy (Vasquez, 2012). Their teaching approach entailed problem posing methodology (Freire, 1970) where they encouraged reading their worlds as self to text and text to world intertextual connections (Rosenblatt, 1994). The lessons encouraged not just the students to interrogate their identities as they were being shaped by sociocultural agents like family, media, and institutions but also for the teachers to reflect on what male identities they embodied and authored according to the master narratives. The participants in Lara’s study created counternarratives as a way to depart and speak back to the master narratives that position Latino men as patriarchs, and their primarily Latino students at risk or culturally and linguistically deficient. Implications are offered for teachers to leverage the knowledge in the lived experiences of the students and teachers as tools to interrogate meaning making of various texts within differing contexts of power, agency and identity.

Lara’s and Fránquiz’ (2015) study used figured worlds (Holland et al., 1998) as a sociocultural frame to explore the positioning and authoring of three Latino male bilingual education teachers and their students. The findings illustrate how the men were able to read the ways in which they were figured as males by their teacher colleagues and how they encouraged their students to read their worlds. Through the various discourses of administrators and other teachers these men were presented with situations in which they could take on the role of disciplinarian or engage in hypermasculine activities. At these junctures these men were faced with the option to toe the line or enact their agency to author new or alternate identities. These identities were often the topic of conversation in the interactive read alouds where the men authored counter-identities to speak back to the figured worlds of teachers that often position Latino men as machos or overbearing patriarchs. The literacies on display in Lara’s study alternated between traditional and nontraditional types of literacies. Where on the one hand, books were being read, on the surface they explored gender equity topics,

while on a deeper level they encouraged both teacher and students to interrogate their own beliefs and stances for socially constructed gender norms. The home and community became a topic of conversation for children in the study. The students often provided anecdotes of where they had been gendered in a problematic way by their parents or peers. These text to world connections helped the students recognize how their identities are socioculturally constructed. Students illustrated various forms of literacies, for example, they read both books and their worlds. Books offered the possibilities of imagining new worlds and enacting them. As a way to write in their imagined worlds, students often wrote to the characters in the books with advice often in both English and Spanish, showcasing their biliteracy.

Literacy and identity of pentecostal students in church and school

A significant aspect of Dr. Ek's work is the documentation of Chicana/o/x and Latina/o/x experiences and the centering of their voices and perspectives in educational research. Too often, representations of these groups have focused on deficits that contribute to their marginalization. Furthermore, Latina/o/x communities and their practices are often depicted as monolithic; thus, Ek's work highlights the heterogeneity of Latina/o/x identities and the various *Latinidades* that are expressed through literacy in the United States.

Scholars seeking to document the experiences of immigrant Latinos/as/xs have focused on religious institutions as important sites for learning and community building (Baquedano-López, 1998; Ebaugh and Chafetz, 2000; Leon, 1998; Wellmeier, 1998). Religion is often at the center of immigrants' sense of identity and religious institutions serve as key sites for literacy socialization. Yet, studies that focus on Latina/o/x religious literacies are scarce, particularly on non-Catholic Latina/o/xs in the United States. Addressing this gap, Dr. Ek conducted an ethnography that examined the language and literacy practices at a Pentecostal church and how Latina/o/x bilingual children and youth's engagement in Sunday school socialized them to identity. Ek (2005) found that children and youth were socialized to a Latino Christian Pentecostal identity through Bible readings, prayers, songs, and the use of other Pentecostal texts in Spanish. The construction of a unified Latino Christian Pentecostal identity blurred the Mexican, Guatemalan, and Salvadoran national identities of the participants (Ek, 2005). In addition, the Bible was a tool for building a Christian Pentecostal morality and identity and reading the Bible in Spanish was a community building activity as well as a main literacy practice (Ek, 2009a).

A related strand of Ek's Pentecostal study examined the language and literacy socialization to ethnicity, class, and gender of four focal adolescents in the church, their high schools, and homes. In the home, Central American varieties of Spanish constructed Central American identities, and these linguistic varieties of Central Americans marked them as an "other" *Latinidad* within the larger spectrum of a homogenous Latina/o/x community. On the other hand, at school the Central American students defaulted to a Mexican variety of Spanish to blend in with the majority Mexican-origin students (Ek, 2009b). In particular, Ek focused on a longitudinal case study of a second generation Guatemalan American student from the church from the time she was a girl in elementary school through becoming a college student. Her transnational experiences in her parents' native Guatemala served as resources for developing and maintaining her Central American language, literacy, culture, and identity in the United States, particularly in the home setting (Ek, 2009b). Findings also revealed that this young woman negotiated conflictive socializations at home, church, and school by using Guatemalan and Mexican Spanish in strategic ways to construct classed, racialized/ethnicized, and gendered identities (Ek, 2009a). Furthermore, Ek found that the church afforded all children and youth the opportunities to engage in rich language and literacy practices in Spanish that led to their becoming competent church members whereas the Pentecostal youth who were in the English as a Second Language (ESL) program in their high school were placed in classes that were characterized by a lack of effective instruction and a watered-down curriculum (Ek, 2008). Recently, (Ek, 2019) demonstrated how through participation in the Pentecostal church literacy practices, students acquire knowledge and skills in Spanish that overlap with the literacy standards of the core curriculum. These projects revealed how cultural contexts shaped diverse literacy experiences of bilingual students and as a consequence influenced their expression of identities.

Research on digital biliteracy: La Clase Mágica at UTSA (LCM@UTSA)

Building on her research in home and school contexts, Ek was a Principal Investigator (PI) on a collaborative six-year study of La Clase Mágica at UTSA (LCM@UTSA), an after-school technology club modeled after the award winning *La Clase Mágica* at UC San Diego (Vasquez, 2003). Using qualitative and social design experiment methods (Gutiérrez and Vissoughi, 2010), LCM@UTSA was a university-public school partnership located in a predominantly Latina/o/x working-class area (Ek et al., 2010). As a social design experiment (Gutiérrez and Vissoughi, 2010), the goals of LCM@UTSA included: to address the digital divide by providing access to technology to students at an under-resourced school; to engage children in culturally relevant language and literacy activities in Spanish and English; and to apprentice pre-service bilingual teachers to use technology to foster digital literacies. These goals guided our research design.

Our research questions focused on how the bilingual students' participation in literacy activities with the pre-service bilingual teachers fostered their digital biliteracy and identities. Data included participant-observation field notes, videotape logs of interactions between the kids and the pre-service teachers, and children's artifacts including their email exchanges with a cyberwizard, their *fotonovelas*, and other writings. The research team's analysis of digital literacies was informed by scholarship on literacies and new technologies (Knobel and Lankshear, 2007; Lam and Rosario-Ramos, 2009; Lewis and Fabos, 2005). The team also drew from research that documented that emergent bilingual students' engagement with social media, fan fiction, and multimodal literacies

were key to their identity construction, heritage language maintenance, and second language acquisition (Black, 2007; Lam, 2009; Lam and Rosario-Ramos, 2009).

The findings from the LCM@UTSA study revealed the connections among language, literacy, and the construction of various social identities. Ek et al. (2014) demonstrated how codeswitching in Spanish and English in students' emails and digital auto-narratives was significant to their biliteracy development as well as to building relationships with others. Ek and her collaborators also found that the students' stories provided spaces where they represented their own and their family's identities in positive ways. They also found that culturally relevant literacy texts including using multicultural children's books by Latina/o authors and *foto-novelas* were key to the children's engagement and acquisition of digital biliteracy (Ek et al., 2015; Garcia, 2014; Prieto et al., 2016). Through the creation of the *foto-novelas*, children expressed their present and future selves including achievers, star students, fearless test takers, airplane pilots as well as the cultural and social identities of their parents, siblings, and pets (Garcia, 2014; Prieto et al., 2016). Moreover, these findings from LCM@UTSA highlight that effective university-school partnerships must be steeped in the languages, literacy, and cultures of the communities they serve.

Research on home and family literacies of emergent bilingual students

Guerra's (2015) study employed a sociocultural lens to examine the literacy practices of fourth grade bilingual Latina/o/x students in multiple contexts. Specifically, the qualitative study focused on six focal students in home, neighborhood, community, and school settings. Guerra drew on Gee's (2015) notions of literacy as Discourse to analyze the data she collected which included participant-observation field notes, audio and video recordings of family interactions, artifacts, and interviews with parents, the students, and their teacher. She documented the students' Primary Discourses which are learned in the home and were part of their everyday languages and experiences.

She found that the home and family literacy practices were varied, complex, rich, and dynamic in both Spanish and English. These practices depicted a lively amalgam of traditional genres such as: telling *cuentos* (oral stories); teasing and joking with family; Bible reading and quoting; playing table games; and reading of cultural texts, such as *fábulas* (fables). Conversely, media literacy practices mediated by modern technology including computers, TV, cell phones, video games, music, and social media were found to be prevalent across the participants' households. One student participant for example, engaged in intergenerational literacy activities with her grandmother, aunts, mother, and siblings. They played the table game *Lotería* and watched *telenovela* (soap operas) together. At the same time, she played video games with her siblings who taught the youngest ones how to play. The older siblings socialized the younger ones to newer media literacy such as watching YouTube videos that taught them to draw their favorite cartoon characters.

Language brokering and translanguaging characterized the literacy interactions between children, their younger siblings, and the older generation. Guerra found that the fourth-grade focal children used their newly acquired knowledge in two languages to translate for their parents, family, classmates, and teacher. Thus, the emergent bilingual kids were positioned and positioned themselves as experts of language and literacy. One focal student, for example, translated from English to Spanish when he showed his mother and his siblings how to use a laptop while explaining that the family needed to save money to get internet services. The focal children constructed bilingual identities that reflected how savvy they were in using technology, but at the same time knowledgeable about the traditional literacies passed down through generations. In addition, emergent bilingual children's translanguaging in literacy activities reflected multiple varieties of Spanish including Spanish of the Southwest, Mexican Spanish, Honduran Spanish, and Colombian Spanish which marked their identities.

Research on language and literacy of Latina/o/x lowriders

Sánchez's (2017) research examines the language and literacy practices in a Latina/o/x lowriding community. This study provides a focus on the social practices within the lowrider community to uncover the multiple and diverse literacies usually hidden to outsiders of these non-mainstream communities. This study served to advocate for alternative discourses that have historically stigmatized the lowrider community by reconceptualizing literacy as a challenge to traditional definitions of literacy commonly privileged in learning institutions. In addition, this study highlights the intersection of language and literacy in lowrider culture that serves to construct a lowrider identity.

The focal participants in this study were members of several local lowrider car clubs based in a South Texas city. The data for this study was gathered during a period of about five years and included participant observations, fieldnotes, interviews, and audio and video recordings collected during car shows, car club meetings, and social gatherings organized around cruises and hop-offs. Written texts taken from flyers and social platforms were also analyzed and provided evidence of the relationship between language and identity. In addition, the analysis of the data collected in this study revealed how lowrider identities are multiple and constructed through lowrider language, values, cars, bikes, and dress. This "identity kit" (Gee, 2015) included a way of acting, talking, and writing that communicated to others their particular role as members of a lowrider community.

Central to this study and to the construction of a lowrider identity was the use of linguistic variations in the Spanish oral and written language to mark a lowrider identity. The analysis of the use of lexicons and vernaculars specific to members of the lowriding community emphasized how language is used to express a lowrider identity. Online communities such as Facebook provided a space where a specific style of language, or vernacular, became a linguistic marker of a lowrider identity. Terminology describing social practices of this community, such as talking about a hop-off, represented multiple meanings and the understanding of these

meanings was contingent upon membership in this lowriding community. Another aspect of language that constructed a lowrider identity was the use of Spanglish or Chicano slang, also known as Chicano or Mexican slang to this particular community of Latino/a/x lowriders. This particular language style, characterized by unconventional grammatical rules and heavily influenced by Spanish, is created within the space of Latina/o/x lowriding. These language variations used in both oral and written texts serve as linguistic symbols of what it means to be a Latina/o/x lowrider in this South Texas city.

Conclusion

We began with situating the sociocultural theories of learning and development as essential to understanding how literacy and identity are shaped across the context of home, school, church, and social life. It is important to recognize how literacies extend beyond the basic notion of reading words in a textbook to include the social and cultural contexts where sensemaking of any text, in or out of school, is informed by social institutions and power relationships and how the reader is situated based on beliefs, customs, identities and experiences. While identities are socioculturally created and prescribed to some degree, the ability of individuals to engage in critical readings of their worlds aids in the recognition of agency to author their own new or separate identities.

We have provided a non-exhaustive survey of literacy and identity across multiple contexts. When considering other types of literacies and pedagogies for culturally and linguistically diverse students, readers may explore concepts such as: funds of knowledge (González et al., 2005), funds of identity (Esteban-Guitart and Moll, 2014), culturally relevant pedagogy (Ladson-Billings, 2009), culturally sustaining pedagogies (Paris and Alim, 2014) and community cultural wealth (Yosso, 2005).

The encyclopedia authors' body of research is significant because the studies presented here examine and create spaces that foster the multiliteracies and multilingualism of culturally and linguistically diverse individuals. Too often, the multiple literacies (Comber and Simpson, 2001) of students from culturally and linguistically diverse groups—particularly bilingual, immigrant, students of color—go unrecognized, are devalued, or are untapped by those in power (Morrell, 2004). Hence, our own scholarship illuminates the rich, complex, literacies of working-class students and their families that open up spaces for them to author themselves in powerful ways. Moreover, the knowledge and skills gained from literacy practices in out-of-school contexts can be leveraged in the classroom. Thus, we call for teachers of working-class bilingual students to foster opportunities for students to bring their home identities and Discourses (Gee, 2015) into the classroom. Our research can serve as a resource for teachers, administrators, and policymakers to become more aware of the everyday negotiations of the development of literacies and identities in our classrooms, churches, student homes, and everyday activities. Finally, we hope to shed light on the beauty of our participants' knowledge and practices as a way to encourage more equitable educational and institutional approaches for culturally and linguistically diverse students, their families, and communities.

Introduction

Religious influences on the growth of literacy practices are well documented and span more than a century of research ranging from disciplines such as social and cultural anthropology to sociology to language and literacy studies in education. Intellectuals known across disciplines such as Benedict Anderson, Lila Abu-Lughod, Pierre Bourdieu, Jonathan Boyarin, Clifford Geertz, Michaela de Leonardo, Shirley Brice Heath, Alan Peshkin, Claude Lévi Strauss, and Brian Street broke new ground in the 20th century in connecting literacy to religious literacies. In recent years, the work of contemporary language education scholars such as Huamei Han (2018) as well as English education and literacy scholars such as Juzwik et al. (2022) have illuminated the nexus of education, literacy, and religious expression in an intellectual and academic milieu that has typically espoused secularly-minded scholarship. This chapter explores contemporary research in the 21st century that suggests that researchers' questions about religious influences on literacy practices has shifted over time and is also indicative of scholars' own changing reflective stances toward the impact of religious literacies in education.

Language and literacy learning

Organized religion creates cultures around rituals that are maintained and passed from generation to generation. As ancient religions have evolved into the 21st century, many have seen a shift to more modernized practices. The current scholarship on language and literacy practices within religious contexts focuses on religion as a way to foster social communities by linking the ancient rites of the religion to everyday life.

Several studies have examined the literacy practices within religious groups, especially concerning the three major belief systems: Christianity, Judaism, and Islam. All three religions require literacy practices to be fully engaged in the worship services. The use of prayers, recitation, and singing are all examples of ways religious communities engage in literacy practices. The focus in these kinds of practices is not comprehension, but rather, rote memorization (Baquedano-López, 2008; Moore, 2015; Rosowsky, 2013). Many young people attend Qur'anic and Hebrew schools or a Christian Sunday School to engage in the memorization of ancient religious texts like the Qur'an, Torah, and Bible. The comprehension of text is secondary to the fluency and oral expression of reading/speaking the text because the meaning is orally communicated by religious leaders.

Other studies suggest that students who engage in literacy practices are exposed to a wider variety of genres and forms of language that are not present in public school systems today (Baquedano-López, 2008; Papen, 2017; Rosowsky, 2013). The understanding of students' religious literacy practices is important for educators to know because many students are engaged in a wider variety and more difficult texts than what is available in schools (Rackley, 2014; Papen, 2017). The comprehension of ancient religious texts is secondary to their memorization because its purpose is to allow for more engagement in the worship service and build a sense of community among church members.

Research on both immigrant and native religious groups shows a strong relationship between religious rituals and community. Learning to perform and participate in the rites of worship creates a community that many immigrants seek when adjusting to a new country and culture. Immigrants are especially susceptible to the pulls of religion as a community. In Han's (2011, 2014) pioneering research on Chinese immigrant conversion to Christianity, she found that the participants were originally seeking a community of English speakers in which to practice communicating in English. The participants of the study found the local community college English classes too formal but enjoyed the informality of conversational English through Bible study. While they were not interested in converting to Christianity, the couple in Han's (2011, 2014) study became hyper-involved in the church because of the inclusion

of their own cultural practices within the religious customs. By code-switching each member of the community was given a voice and felt empowered to use it (Han, 2011, 2014).

The use of religious schools as a counterbalance to the public school curriculum is another facet of religious literacy research that has emphasized community ways of knowing over individual comprehension of the text. In Rackley's (2014) study on literacy practices of Latter-Day Saints and Methodist youth, he found that even within a commonly known religious Christian sects, there can be cultural differences. Through his analysis of religious texts, he found that Methodist youth engaged in a *culture of interpretation* that created meaning through small group discussion. On the other hand, the Latter Day Saints youth engaged in a *culture of listening*, where the interpretation was given to them by elders in the church. Understanding the teaching and interpretation of religious texts is informative for developing a more nuanced understanding of the connections to public school pedagogy that bridges the out-of-school literacy practices with the requirements of academic language (cf. Sarroub, 2001, 2002, 2005, 2007a, 2007b, 2009a, 2009b).

Although religious practices are entrenched in ancient rituals, a recent trend in the research is showing a change in the ways young students are learning Ancient Arabic and Hebrew. Children's attendance at Arabic and Hebrew schools is an important cultural aspect of both religions because the ancient language is such an integral part of worship services. In Moore's (2015) study on West African Muslim families, she discovered that more families were choosing the French-speaking public schools over traditional Islamic day schools. Instead, their children were learning ancient Arabic by attending night classes. This approach to religious language learning is described as a counterbalance to the privileged French-speaking public school. This new way of learning has also shown an uptick in girls' attendance compared to boys in Muslim schools (Moore, 2015). In the same vein, Sarroub (2005) showed that Yemenis and Yemeni Americans in Michigan chose to send their children to public school during the week and to "Arabic School" at the local mosque on Saturdays and Sundays.

In 2019, Rosowsky revisited her primary field site and research about the sacred language practices of Mosque schools in northern England. In her original study (2008), she found that most students and families of the Mosque schools were first- or second-generation immigrants from the same country with the same home language, primarily Urdu. Twenty years later, Rosowsky (2019) saw a shift in Qur'anic study in English, the common language of the more diverse population of the schools. With an influx of immigrants from many parts of the world, and the establishment of a stronger multi-generational community, the use of the English language is an imperative tool for interpersonal communication within the Islamic school classroom (Rosowsky, 2019).

Literacy practices among the three major religions- Christianity, Judaism, and Islam-are important to maintaining the ritual practices of worship. The scholarship in this area demonstrates a prevalent emphasis on the decoding and fluency of religious print texts over comprehension and interpretation. Students of sacred languages are not asked to develop their own understandings of the text, but rather, to recite them as members of a faith-based community. There has also been a shift to maintaining institutional religious memberships and bridging the sociocultural practices of youth with the literacy practices of their religions.

Identity construction via literacy, language, and religious practices

Religion, or lack thereof, is an important aspect of individual identity. While church and state are fiercely separated in the United States, especially regarding public schools, religious beliefs often undergird students' classroom discussions. This section explores recent scholarship about the links between individual identity, religion, and public institutions, and it addresses how religious literacy practices are being used to build community among immigrants and US-born populations. This section also highlights research about how young people utilize religion to negotiate religious, social, and cultural spaces.

Bigelow (2008), for example, studied the intersection of immigrant identity and religious practices within public institutions such schools. As immigrants in a new dominant culture, Somali youth struggled with the racialization of being seen as Black and not African, while dressing in a hip-hop style and adopting the African American vernacular English along with the standard variety to fit into the social aspects of school. Despite this conformity, Somali teens wrote, "Somali," "Muslim," or "Other" on forms for school that indicate racial categories.

Choi and Tinker Sachs's (2017) case study focused on how multilingual students negotiated their identities when reading multicultural literature. Four male participants from India, Uzbekistan, and Korea participated in Saturday morning book clubs that met for five months. Two of the boys identified as religious- Muslim and Hindu- and the other two identified as atheists with no religion. The young men used their religious knowledge gained from their home lives to create nuanced understandings of the multiethnic literature they were reading. The researchers documented how differing perspectives about religious beliefs became a source of tension among the boys as they naturally drew on their religious identities to make meaning from the text. These studies are important in understanding of religious literacy because they demonstrate the ways multilingual youth use religion to interpret texts secular literature. It also shows the importance of teachers allowing various religious perspectives into the classroom to foster dialogue and understanding among participants.

Research such as Han's (2007) ethnographic case study provides a lens into a different educational setting for adults. She followed one Chinese immigrant couple, Grace and Timothy, as they navigated their new life in Toronto, Canada. Han outlines the couple's settlement in Toronto as being traumatic for the newlyweds. Timothy and Grace struggled to find meaningful work and make it financially in Canada. They found a community in the evangelical Christian group that they joined and used expressions such as "God's plan" to make sense of their experience and find calmness. At the heart of this study is the gender and language shifts of Grace and Timothy that occurred through their involvement in the evangelical Christian group. Han (2007) found that Grace took on a dominant and outspoken role in private, often keeping a steady job to keep the family afloat. However, Timothy

took on a more dominant role in group conversations, especially in the church's English language classes. Han's findings suggest that immigrant women tend to be particularly vulnerable to gender stereotypes despite the efforts at gender equality in Western liberal democracies.

According to Han (2007), evangelical churches in Canada utilize English language classes to build community and connection among immigrants, and by the same token, there is the expectation that they will convert to Christianity despite any desire to do so before encountering the group. However, Han's (2011) research explored the participants' sense of "otherness" via normalized racial and structural discrimination as a reason for their interest in finding community through Chinese nationalism, and thus, saving their country through Christian evangelism. Despite the hardships encountered during their settlement in Canada, Chinese immigrants were able to find a positive identity within the evangelical Christian community.

In her case study (Reyes, 2009) followed one high school Latina girl, Zulmy, for 10 months at school and in her home to explore how she negotiates her religious identity in a public space, such as school. The main source of data came from Zulmy's science scrapbook which she crafted for the biology club, and, which, incidentally, had very little to do with science, but rather, it included reflections on her religion and her relationship with the material world. Reyes (2009) concluded that Zulmy's religious identity is complex and sometimes contradictory. For example, one entry was an inspirational poem about "God" and the next page was a visual that sent the message: "I love Mickey Mouse, a symbol of American consumerism." Through this scrapbook, Zulmy made sense of the different facets of her identity by integrating the pieces of her religion, culture, language, and relationships into one artifact. One could hypothesize that the scrapbook could be what Sara Ahmed (2010) calls a "happy object," in that its significance drew on contemporary media and religious texts that helped Zulmy make sense of her world.

Recent scholarship has also focused on Christian religious identity of US-born citizens in public schools. Research in this sub-field, which has roots in the pioneering work of Alan Peshkin (1986) in an evangelical Christian community, calls attention to the importance of studying this population because of the emphasis placed on their beliefs and values in US politics. For example, Juzwik's (2014) critical review of the Biblicism tradition in American Christianity argued that Biblicism, a belief in the authoritativeness of the Bible is a literacy event because it requires the reading and interpretation of complex religious texts. Juzwik suggested that researchers should study this population because it includes the largest religious group in the United States, one that develops strong identities as Biblicist Christians and focuses heavily on evangelizing to transform lives. The emphasis on proselytizing and conversion is problematic in religiously pluralistic settings such as public schools, and Juzwik noted that research further research offers a deeper understanding of their literacy practices for evangelization. With a more optimistic view than that of Peshkin (1986), Juzwik argued that gaining insight into evangelical Christian religious literacy practices, dialogue across ethical differences can be promoted to gain a broader view of the world.

In 2015, Juzwik and McKenzie's qualitative study included both a teacher and student who self-identified as evangelical Christians. Sam, the teacher, conducted a "This I Believe" essay writing unit wherein he invited students to explore their own beliefs and morals while hearing from others who may be ethically different. Charlie, an evangelical Christian student in Sam's class, saw the unit as an opportunity to honor "God" and "His" word through his own literacy practices. The findings from this study indicated that there are differences even among members of the evangelical Christian belief. For example, Sam, the teacher, was older and more accustomed to discussion that included different viewpoints and ideologies. Charlie, the student, on the other hand, has not learned to participate in or value cross-faith dialogue. Ultimately, Juzwik and McKenzie (2015) argue that educators ought to take the religious roots of students into account and develop avenues in the classroom to engage them in dialogue.

However, there has been a limited number of studies that explore the interactions of youth religious beliefs, literacy, and motivation. Rackley (2016), in turn, contributed to the development of religio-cultural theories in literacy studies. In his qualitative study of Latter-day Saint and Methodist youths' motivation for reading complex, religious texts, the findings revealed that the young people in both religious groups were motivated to read and comprehend complex religious texts because they wanted to apply them to their lives, endure challenges, find comfort, and connect with "God."

Using a multiliteracies framework, Skerrett (2014) examined how religious literacies are used to make sense of the secular literature that students read in class. Using a qualitative case study design, data was collected over one year in Ms. Campbell's ninth grade classroom. The students in the study were members of a diverse high school in the southwestern United States, and many of them self-identified as Mexican or Mexican American. The findings suggest that, with the teacher's support, students were able to draw on their religious literacies to analyze and evaluate the secular literature read in class and within their academic writing. Skerrett also found that tensions arose during class discussions that involved religious identity, but there was a strong sense of community based on shared values and empathy for others that helped students navigate through these tensions with their teacher, who also understood their more nuanced religious viewpoints.

In another study about evangelical Christian students and their interactions with a secular literacy curriculum in the United States, Weyand and Juzwik (2019) pointed out that literacy education in midwestern public schools was developed according to evangelical Protestant print literate norms, and therefore, evangelical Christian literacy practices have been excluded. This study focused on an evangelical Christian young man's responses to a community-based curriculum that required him to intern with a traveling college campus preacher.

Jeremy, the student participant, was given the opportunity to publicly identify as a Christian and justify his beliefs using Biblical scripture. This dialogue was evidence of his willingness to share his faith with others by inviting discussion, and thus, scrutiny of his beliefs. In turn, it demonstrated a readiness to understand others and their views. This was something that Jeremy was not open to doing prior to the internship. Like Charlie (Juzwik and McKenzie, 2015), Jeremy is another example of students adapting curricular goals for their own religious exploration and identity development. Further research is needed to fully examine young people's

religious-related decisions and literacy practices in school spaces, especially those of historically minoritized groups who face discrimination (cf. [Mir and Sarroub, 2019](#); [Sarroub, 2001, 2002, 2005](#)).

[Wynter-Hoyte and Boutte \(2018\)](#), for example, contributed a qualitative case study that focuses on Melissa, an African American girl in the third grade as she navigated the literacy worlds of church and school. The authors implemented Cultural Historical Activity Theory (CHAT) as a framework as well as a post-structural identity theoretical perspective that instantiates identity as non-static, pluralistic, and adaptable to one's environment. These frameworks illuminated interaction and learning differences across church and school settings. At church, Melissa's literacy practices were predominantly communal, i.e., praying for one another and sharing testimonies. The church community also embraced African American Vernacular English (AAVE), such as the call and response speech pattern within the services. Other examples of communal practices included small group instruction for the children wherein they engaged in a close reading of the Bible and role-playing biblical stories. Melissa's classroom literacy practices, modeled by her African American teacher, focused on individual learning. There were few peer interactions and the lessons focused on standardized testing skills. Melissa navigated both institutional literacy practices seamlessly and was able to participate successfully in both environments. Wynter-Hoyte and Boutte pointed out that ways of participating in literacy activities in the church setting could be a resource within a school to activate communal and multiple literacies to benefit all students and help develop stronger relationships between students and teachers.

Power via literacy, language, and religious practices

While religious beliefs are an important aspect of many individual's identities and sense of belonging, it is institutions that systematically wield power an often for their own gains. This section explores the relationship between religion and power and the impact it has on people's lives as they implement their political and social agendas. [Baquedano-López \(2004\)](#), [Hsiao et al. \(2018\)](#), and [Kim \(2019\)](#) explored the ways in which church groups use the English language as a source of evangelizing new members and acculturating them to the dominant culture. Other researchers have studied this dynamic in China, which is experiencing rapid migration ([Wang, 2018](#); [Wang and Froese, 2019](#)). Lastly, [Shaw \(2019\)](#) and [Vikdahl and Skeie \(2019\)](#) explored religion and power in European Union countries that required religious education as a part of their overall curriculum and the inclusion of dialogical activities in the classroom.

[Baquedano-López](#) took an in-depth look at a Catholic religious education program in Los Angeles, California serving Mexican immigrant families as they eliminated the Spanish-based class (Doctrina) in favor of "English-only" instruction. The church resided in a working-class neighborhood of mostly Mexican and Central American immigrants that were fluent in both English and their native language(s). Families enrolled their students in the Doctrina program because of the cultural connection and emphasis on the Spanish language. Even though the program was much larger than the English-only class and served well over 100 students, it was eliminated from church programming. The Latinx leaders of the Doctrina class resisted the insistence on English-only by continuing to conduct classes in Spanish, an alternative third space. [Baquedano-López \(2004\)](#) used de Certeau's *strategies and tactics* to describe the phenomenon that took place at this church. The church leaders implemented an English-only policy as a strategy to diminish the influence of the Spanish language and culture, while the Latinx leaders disregarded this policy by continuing to utilize the language as a connection to the community and culture, thus demonstrating the nexus of religion and power and the ways in which marginalized people subverted the dominant.

In their three-year ethnographic research of Chinese immigrant families, [Hsiao et al. \(2018\)](#) studied a Christian church after-school program, in which they found startling differences between the experiences of working-class and middle-class Chinese immigrants and their relationships with the church. The working-class Fuzhunese-Chinese families were concerned about the pressure to convert to Christianity but saw the program to improve their children's performance in school, especially in learning English. On the other hand, middle-class Chinese families could choose whether to participate in religious or non-religious educational opportunities as a tool of integration. While all Chinese immigrant children in this study socialized into Christianity at varying degrees, the class status of the family determined in which activities they could participate. The middle-class Chinese families, both Christian and non-Christian, saw church activities as social gatherings, whereas the working-class Chinese families who resisted Christian norms lost an opportunity to acculturate into society, and thus, were "othered" by the dominant norms of the Protestant Christian community.

In non-US settings such as North Korea and South Korea and the European Union, power dynamics are at play in the context of English language and literacy learning. For example, [Kim \(2019\)](#) explored missionary English teaching sites and the access to power and privilege they hold for minority population participants through the political economy of language and society. The main purpose for missionaries in this economy is to convert non-believers to Christianity, whereas the top priority of the North Korean students is to learn English to gain education credentials, so English serves as a currency for career advancement. Evangelical Christians in South Korea used English as a tool to evangelize North Koreans. More research into this phenomenon can provide us an opportunity to understand "the dominant ideologies and power relations of the larger society" ([Kim, 2019](#), p. 21) for which [Han \(2018\)](#) argued in her initiative to build a subfield focused on religion and language acquisition.

Research in the European Union context offers a more expansive view of religious literacy integration in curriculum. [Shaw \(2019\)](#) studied European Union countries that are required to provide a religious education curriculum to their students. The educational model suggested in drew on data from a national study of educational stakeholders' views in Great Britain. Shaw used [Dinham and Shaw's \(2017\)](#) framework as the tool to develop quality religion and worldview literacy instruction for students using the strands: *category, disposition, knowledge, and skills*. The data from stakeholders suggested broadening the *category* of religion and

worldview to include the informal-the lived social and political experiences of individuals to gain “authentic representations of religion and worldview” (Shaw, 2019, p. 5). Similarly, *disposition* of religion and worldview literacy promoted self-awareness and intercultural understanding toward religion instead of a preconceived set of principles of tolerance and respect. The knowledge strand asked students to consider the relationship between the religious and the secular and engage in dialogical practices to understand the complexity of religion and belief as it is constructed by individuals. Finally, the skills associated with religion and worldview literacy, discernment, meant the ability to self-examine one’s own beliefs and worldviews while also engaging in dialogue about someone’s religion or belief with grace and sensitivity. Shaw advocated for a critical lens when thinking about religion and worldviews. She also suggested that religious education classes be used to not only educate students in the major world religions but also as an opportunity to gain self-awareness and understanding of students’ beliefs and worldviews.

Using a comparative case study design, Vikdahl and Skeie (2019) analyzed religion and dialogue within education in London, England; Hamburg, Germany; Stockholm, Sweden; and Stavanger, Norway. While each country has distinct curricular goals, all case studies fit into the European research project “Religion and Dialogue in Modern Society” (Weisse, 2010). The findings from this cross-case analysis showed that while students like engaging in religion-related dialogue at school, they found it to be difficult to understand a broader view outside of their own personal opinions and beliefs. Students also indicated being insecure about sharing their own religious beliefs, especially if they differed from those of the majority, and feared social consequences from their peers. Teachers found that religion-related dialogue was threatened by “historical, religious, and political conflicts” (Vikdahl and Geir, 2019, p. 124). Also, the emphasis on curricular standards, learning goals, and assessments restricted dialogical practices in the classroom. Implications from this study suggest that dialogical practices are not just a teaching tool for students, but a set of skills they need to make sense of the world in which they live.

In turn, Wang (2018) provided insight into the largest ethnic minority group in China, the Hui, and their experiences migrating from rural to more urban areas in northwest China for economic opportunities. Almost 100% of the Hui identify as Muslim which has caused conflicts for them in the new urban setting. The participants in this study included fifteen seventh and eighth grade students who had moved to the region within the past five years. Through narrative stories, semi-structured interviews, and field observations, Wang (2018) found that all the participants distinguished themselves by their multiple identities but placed their religious identity of Muslim above the rest. Other findings point to an incompatibility of secular culture and religion. Religious symbols are not allowed in Chinese public spaces, including schools, therefore, students were not able to wear traditional Muslim clothing, nor were they given time to pray during the school day. Since pork is the main meat consumed in the region, Muslim Hui found eating out difficult. The fasting obligation during Ramadan made it challenging for students to concentrate on their schoolwork and many admitted to not participating the whole month.

The implication of the study is for schools in this region to develop more culturally relevant pedagogy practices to help students integrate their religious beliefs into the secular classroom and to become more adept to the urban environment in which they are living. School accommodations for Muslim students who fast and cannot eat pork is also relevant as it was in Sarroub’s (2005) ethnography of a high school in Michigan that was the academic home of a large Yemeni and Muslim population and whose administrators implemented inclusive accommodations in the cafeteria and classrooms. The conflict the participants experienced in northwest China adapting to the dominant Han culture while also wanting to maintain their religious beliefs and customs is a good example of power dynamics that involve both religious and rural population minorities. This scholarly research is imperative for understanding ways in which institutional powers weaponize religion to further minoritize people.

Additionally, Wang and Froese (2019) analyzed data from the 2010 Wave of the China General Social Survey to better understand the relationship between education and religious tolerance in China. The survey data concluded that education was the largest variable in determining religious tolerance among Chinese citizens. The more education an individual attained, the more open they were likely to religious diversity. At the same time, Chinese respondents noted that religious institutions are dangerous and should be socially and politically regulated so that they do not influence the decisions of the government. The researchers recognized the harsh religious laws in place in China and concluded that highly educated individuals may be reluctant to share their religious beliefs openly and honestly. Therefore, the openness to religious practices and the skepticism of their secular influence needs to be examined more fully using a qualitative research design. Wang and Froese acknowledged the people’s fear in responding to the survey and even alluded to the example of Muslim re-education camps implemented in rural China that may have contributed to less than forthcoming survey response.

The research about power via religion, language, and literacy demonstrates the symbiotic, political relationship that religious institutions have with schools and government to maintain their status. The English language classes (Kim, 2019), safety and academic support (Hsaio et al., 2018), and formation of a cultural community (Baquedano-López, 2004) provided by these religious institutions disguise their intent of assimilation according to Protestant cultural norms. This is contrasted by the research in China (Wang, 2018; Wang and Froese, 2019) involving religious individuals living in a country that does not openly recognize nor accept religious practices in any setting, private or public. Shaw’s (2019) aforementioned research and dialogical framework offers an in-between option for accommodation and education in such settings.

Practices in the classroom that engage religious literacies pluralistically

The world in the 21st Century is more interconnected than ever before, but the religious differences continue to foster tension and conflict within governments and communities. Scholars continue to advocate for religious pluralism despite the shift of leading

democracies to a more nationalist worldview (Lockley-Scott, 2019). In 2010, the European Union published a report on the effectiveness of the religious education (RE) requirement in European public schools. The conclusions of the study demonstrated a need for schools to make a place in their curriculum for dialogue and discussion about religious and non-religious worldviews (Weisse, 2010). Strengthening the religious and cultural dialogue would promote intercultural understanding, respect for otherness, and coexistence in a democratic society (Weisse, 2010). The lofty goals outlined in the report were met with obstacles when individual school systems attempted to implement the practices within their own classrooms.

For many European RE teachers, the purpose of the compulsory class was to provide students with a comprehensive view of the world's major religions to create citizens prepared to participate in a democracy (Liljestrand, 2016). In a small study of nine RE teachers in Sweden, Liljestrand (2016) found that the educators struggled to determine whether democratic citizens were created by focusing on the similarities or differences of the religions studied. The findings suggested that individual teachers' approaches to RE were situated within "how they define themselves as teachers when certain issues are explicitly addressed" (Liljestrand, 2016, pp. 328–329). Niemi et al.'s (2019) study supported the notion of reflexivity being a major factor in individual teacher's approaches to RE. In a survey of 181 Finnish pre-service and practicing teachers of world religions, the results showed that younger, less-experienced teachers favored an approach that called more attention to differences by providing students with religious exemptions from certain school activities, gender-based grouping when necessary, and spaces to pray at school (Niemi et al., 2019). Older teachers, on the other hand, tended to lean toward similarities as they attempted to show tolerance and acceptance but did not go so far as to make accommodations for those students (Niemi et al., 2019).

Currently, the practices surrounding religion in the classroom are unique to the beliefs and values of the teachers and the geographical regions in which they teach. The US recognizes the diversity of religions and cultures within the country and attempts to preserve equity among all groups by maintaining a clear and strong division between church and state. The numerous court cases surrounding the legality of public displays of religion in schools demonstrates the resistance to any kind of education or dialogue on the topic of religious diversity within classrooms (Bindewald et al., 2017). In recent years, Canada began following the US model and secularized its public schools to better accommodate diverse student population (Bindewald et al., 2017). The result of a lack of RE in US and Canadian public schools has been "high rates of religious illiteracy" (Patrick et al., 2017) among its student populations. Richardson (2017) and Patrick et al. (2017) argued for RE classes in public schools because they offer the skills required for opening dialogues among religious and secular worldviews and give minoritized religions the space for recognition within their communities (Davila, 2015; Patrick et al., 2017; Richardson, 2017; Vallerand, 2018). Living in a diverse and democratic society requires more from citizenship education courses than the teaching of tolerance; it must also focus on respect and coexistence (Patrick et al., 2017; Weisse, 2010).

While the scholarship shows a need for public schools to embrace RE, the *how-to* is a little more ambiguous. Lockley-Scott (2019) and Vallerand (2018) both advocated for the implementation of religious dialogue in UK and US schools, respectively, as a way to decrease cultural tensions and explore their own identities, but the nationalistic worldview recently adopted by Great Britain and the US has not been conducive to religious pluralism (Lockley-Scott, 2019; Vallerand, 2018). Before religious dialogue can take place in the classroom, the political context of the nation state must be more open and inclusive of diverse and multiple worldviews. Additionally, teachers require on-going professional development opportunities to be more confident in engaging their students in controversial topics (Davila, 2015; Lockley-Scott, 2019; Richardson, 2017). Without professional development and practice, RE teachers may end up doing more harm than good (Davila, 2015; Dinham and Shaw, 2017; Lockley-Scott, 2019; Vallerand, 2018).

The navigation of the landscape between religious and secular worldviews in public schools is a bit like an obstacle course. The scholarship supports the need for all people of democracies to learn the cultural values and beliefs of the religions that are prevalent in their communities, but a nationalistic political climate fosters fear of outside, minority populations (Dinham, 2017; Juzwick, 2014; Patrick et al., 2017; Richardson, 2017; Vallerand, 2018; Weisse, 2010). Instead, teacher education programs ought to include tools for engaging pre-service teachers in pluralistic dialogue in their classrooms such that they are better prepared to participate in the democratic societies they will inherit (Davila, 2015; Dinham, 2017). A glimmer of hope that religious pluralistic ideas can come to fruition appeared in Addai-Mununkum's (2016) multi-case study wherein he observed the pluralistic practices of three schools affiliated with different religions. The results show that despite the diverse religious backgrounds of the students at each school, the Muslim school demonstrated more evidence of engaging in a dialogue with Christians than the Christian schools showed to their Muslim students. The focus on moral education and learning from one another set the Muslim school apart from the other two religious schools and allowed all students to feel and be welcomed in its space (Addai-Mununkum, 2016).

Western democracies could learn from the Muslim school in Ghana, Africa. The impact of religious literacies in education should not be a taboo topic in public schools. Rather teacher preparation programs and professional development workshops should consider providing teachers the tools necessary to engage young people in critical conversations focused on religion, multiple world views, and a diversity of perspectives grounded in historically, sociologically, anthropologically, linguistically informed practices that are accurate and factual. The current nationalistic climate and Islamophobia that is rampant across the world could be snuffed out with an open-minded approach to critical conversations and education surrounding religious literacies (Mir and Sarroub, 2019). As the 21st century continues to unfold, a less insular approach to inquiry in language and literacy studies about the influence of religious literacies could potentially offer new questions and answers such that people do less harm to one another, and young people learn to talk and argue democratically. As Durkheim (1912) pointed out, religion is the product of human activity, not divine intervention, so scholars and educators can study it as such and help teachers be more confident in engaging with their students to better understand religious literacies in society.

Introduction

Critical literacy and social justice theories are both related to the exploration of power, privilege and equity. Critical literacy is an approach to language and communication education that teachers explore with students and colleagues to engage in deep thinking and substantive analysis of unequal and oppressive power relations. This approach enables teachers to advocate for dismantling of systemic injustices, and to propose change. As authors writing this entry, we acknowledge that much of the schooling discussed is based in settings that to various degrees reflect a history of colonization, and that the entry reflects this Western perspective. We heed Maori scholar [Smith \(1999\)](#), who stated that "social science... is not an innocent or distant academic exercise but an activity that has something at stake" (p. 5). This is certainly the case for critical literacies, which have grown out of Western education and academic traditions. As [Tuck and Yang \(2014\)](#) point out, the academy itself is "as an apparatus of settler colonial knowledge already domesticates, denies, and dominates other forms of knowledge" (p. 235). With these limitations in mind, we note that there is no one "right way" or single definition of critical literacy or social justice, though there are commonalities in their theoretical underpinnings, requiring serious engagement with issues such as diversity, privilege, fairness and equity for people, animals and the earth.

This entry begins with a discussion of critical literacy and an overview of the interplay between school education, literacy and social justice. We introduce critical literacy as a field, including its theoretical underpinnings. We then use [Fraser's \(2008a,b\)](#) three dimensional model of social justice to consider how critical literacy has been taken up in schools and by education researchers to forward social justice agendas. We conclude by explaining how teachers and students can employ critical literacy as a catalyst for deep learning that enables them to become advocates and allies for justice.

Critical literacies and social justice

Critical literacy is an approach that seeks to unsettle and contest taken-for-granted cultural and social practices, and to use literacy to spark deep questioning and imagine more just futures. In unsettling dominant discourses and practices, critical literacy educators typically explore what [Janks \(1993\)](#) refers to as both "small-p" and "big-P" politics. That is, critical literacy educators examine the micropolitics and power relations that are part of everyday life in schools—for example, exclusion in the playground that is based on racist, homophobic or ableist views, or action for social change, such as how we recycle unwanted objects. In big-P politics, Janks explains that the focus turns toward wider, structural power mechanisms such as how governments attend to issues of racial injustice, global warming and the effects of capitalism and inequality on marginalized groups. As the work of researchers and teacher-researchers such as Anne Haas Dyson, Vivan Vasquez, Timothy Lintner, Summer Melody Pennell and others demonstrates, even young children are capable of understanding complex issues of justice in their everyday lives.

While there is no set definition of critical literacy, key principles have been outlined in the research literature. Critical literacy encompasses the multitude of ways teachers create socially just classrooms and encourage their students to work toward social justice in their communities and beyond. This includes adopting a critical approach toward teaching literacy that sees issues of oppression, justice and power-relations as worthy of inquiry.

Critical literacy is embedded in how teachers approach texts and literate practices. Thinking about how texts are constructed from particular perspectives encourages students to question the assumed neutrality of discourses, practices and texts. Providing opportunities for students to make connections and be curious about their everyday realities and concerns, and problematizing the world around them, are central facets to adopting a critical stance. We recognize with Hilary Janks (2000) that critical literacy can sometimes operate as “a rationalist activity that does not sufficiently address the non-rational investments that readers bring with them to texts and tasks” (p. 7). Critical deconstructions of texts can set up serious, rational discussion that may fail to take into account students’ situated realities. Janks provides the example of her emotional reaction to the terrorist attacks in the United States on 9/11. Janks had flown through New York in the weeks preceding 9/11, which left her with a sense of disbelief, and an “irrational, unconscious, all-consuming” vulnerability that made it difficult to engage intellectually or apply critical thinking about the events at the time. We therefore argue for an approach toward critical literacy that incorporates both rationalist approaches toward the disruption of dominant structures in education alongside an acknowledgment of students’ and teachers’ lived realities. In an increasingly polarized world, this approach to critical literacy may be less likely to alienate, or “preach to the converted” (Janks, 2000, p. 21). For those engaged in critical literacy, this means being open to understanding the “lopsided” influence of Western academic traditions (Takayama, 2009, p. 354), and to make an effort to genuinely engage in critical pedagogic approaches that have alienated minoritized groups.

The reliance of reasoned approaches to critical literacy also has the potential to limit students’ enjoyment and engagement with critical thinking, and texts. In moving beyond a purely rationalist approach, critical literacy becomes a space where enjoyment and playfulness can come together in the pursuit of troubling assumptions and dominant discourses. Hannah Gadsby’s (2018, 2020) acclaimed stand-up comedy specials illustrate how a critical stance can be taken to dominant views on comedy, sexism, autism, trauma and even art history. Her playful approach, including laughter and discomfort for audiences, suggests that humor can convey important messages and spark critical thinking and discussion. We suggest that teachers and students be “given permission to be other than sensible and serious” (Comber, in Janks, 2000, p. 9) when enacting critical literacies for social justice.

In the following section, we draw on some seminal social and educational theory to consider the interplay between literacies and wider social forces, including how literacies have been linked to the reproduction of dominant views and practices. We then consider how critical literacy has emerged as a practice for contesting the inequalities borne out of these political circumstances, with a view to bringing about a renewed focus on social justice and activism in schooling.

Literacy as a political project

Literacy and schooling are inherently political projects, embedded in wider social views around education and childhood. Critical literacy education has often been caught in debates about how literacy in school is practiced (e.g., Luke, 2018), how childhood is constituted, and whether knowledge is seen to be neutral, or imbued with social, cultural and political meaning.

In Western scholarship, the emergence of childhood as a category (as opposed to the treatment of children as adults, as was the case in medieval times) (Aries, 1962) has been linked to the emergence of print and literacy from the Renaissance onwards (Postman, 1985). Literacy instruction was primarily positioned as being about the acquisition of skills, rather than having cultural or political goals such as contributing to more just societies. As alternate approaches emerged that were built on a philosophical belief in literacy that emphasized meaning and saw literacy instruction as a means of contesting unfair power-relations, literacy became one of the most politicized parts of education policy and practice.

Dominant views around the nature of pedagogy have had a significant impact on how literacy is understood and taught in schools. For instance, the late 1800s saw the “scientific management” principles and practices espoused by Frederick W. Taylor being introduced into the field of education (Apple, 2014, p. 92). Developed for factory work, Taylor’s focus was on efficiency, standardization, increased control of work processes, and the maximization of outcomes/results. In literacy instruction, the application of this industrial model has meant a focus on skills that can be most easily standardized and measured such as spelling, language conventions, and the use of standardized/basal readers for teaching decoding and literal comprehension (Hoffman and Alvermann, 2020).

A body of work in a field that has become known as the sociology of education, produced from the 1960s onwards, has become the basis for an emergent field of literacy scholars who sought to understand how intractable race, gender and class based injustices were produced (at least in part) by literacy practices such as inequitable access to texts, and different forms of literacy. Reflecting on the development of the field, Luke (2018) writes that “Young, Bernstein, Apple, Cazden, Hymes, and others—coming from very different foundational and methodological bases—began from the empirically and quantitatively documented social facts of educational inequality” (p. 178).

The seminal contribution of Paulo Freire in the *Pedagogy of the Oppressed* (1974) provided a foundation for critical education and pedagogy theorization. In particular, understandings of literacy as implicated in the construction of the social world emerged in the 1960s and 70s. Freire reimagined literacy as a political enterprise that could take up matters of social justice through pedagogies that seek to problematize and reshape social, political and economic relations. Freire used a “banking” metaphor (in which students are

passive recipients of knowledge) to contest dominant models, and to argue that students could instead be offered pedagogies that raise their consciousness of class-based oppression, and to critically reflect upon social structures. In *Literacy: Reading the Word and the World* (Freire and Macedo, 2004), originally published in the 1980s, he set out to contest technicist assumptions about literacy, explaining how literacy is implicated in (in)justice because it can either empower or disempower, reproduce injustice or lead to emancipatory change. Freire's writings extended from his early work on Brazil and Latin America, to discussion of colonized countries such as Guinea-Bissau (where he organized a literacy campaign in the 1970s), as well as European and North American education systems. Freire's work has been taken up extensively since that time, for example by scholars such as Henry Giroux, Hilary Janks, Colin Lankshear, Allan Luke, and Mariana Souto-Manning who have advocated for emancipatory and decolonizing approaches to social justice, through critical literacy practice. Freire's writing on emancipation, and the importance of consciousness-raising in education was taken up by early critical literacy writers, including those in *The New London Group* (1996). In Japan, the Buraku-min, who have a long history of subjugation have played a strong role in applying Freire's work, in the development of liberatory critical pedagogies (Takayama, 2009). The movement worked to reshape the consciousness of both Baruku children, as well as changing the attitudes of non-Baruku people. Understanding how the approach of scholars such as Freire has been taken up in different contexts is important. As Takayama suggests, too often, progressive voices are silenced in Western accounts of education systems, including Japan. Challenging assumptions about how critical literacy is understood is itself an important means of moving toward more emancipatory approaches. In China, for example, a country that has had longstanding links with Marxism as the official ideology, it might be assumed that critical pedagogies are embedded in education. However, Yan and Chang (2009) note that this is not the case, and that instead, "critical educational studies have ... been considered as capitalistic thought and ideology, remaining unknown until the 1980s" (p. 369).

The theoretical contributions of Pierre Bourdieu, Michael Apple, Allan Luke and others have also been highly influential. A diversity of critical literacy work emerged in the 1970s and 80s alongside other forms of activism and consciousness raising such as second wave feminism and black feminism, activism around diverse sexualities (such as the HIV/AIDS epidemic), and anti-apartheid movements. Luke (2018) reflecting on his early work notes that when he began to apply sociological approaches to literacy in the 1970s, that "much of this work was deemed unscientific and overtly political" (p. 22). Nevertheless, he persisted, along with other researchers and teachers, taking critical literacies forward into the digital era.

In 1996, a group of internationally renowned scholars known as the "New London Group" came together with a view to taking "deliberate, political and intellectual action" (Luke, cited in Luke, 2018, p. 298). Their seminal work around multiliteracies sought to de-center dominant accounts of literacy pedagogies, with their focus on print media, canonical works and decoding skills (phonics, spelling and so forth). Seeking to create a strong commitment to social justice by capitalizing on new online and digital media and the political environment of the day showed how teachers' critical engagement with multiliteracies could alter long-standing inequities such as the marginalization of Indigenous peoples, working classes and other cultural minorities. The group's manifesto on multiliteracies teaching argued that multiliteracies must not only tackle rapid technological changes to literacy, but also, must confront the increasing importance of being able to critical analyze multimodal texts, and acknowledge the cultural and linguistic diversity of students and communities. The group challenged teachers to consider the interplay between local happenings and global events in new times.

Critical literacy through Nancy Fraser's theory of justice

Public debates over literacy and equity are often dominated by reports of gaps in achievement between groups of students as measured on large-scale, standardized assessment programs. In contrast, struggles for equity are concerned with questioning hegemonic power systems that oppress groups and individuals, based on class, race, gender, sexuality, disability and so on. Early theorisations of justice and power (such as that of Marx in the mid-1800s) centered around the unequal allocation of resources, arguing that redistribution was needed to create a fairer society. Efforts to bring about parity that are couched in these terms argue that a lack of economic resources and control, and unequal control of labor constitute injustice. The 1990s saw an increasing emphasis on broader conceptions of justice that includes political and cultural aspects of advantage and domination.

Fraser's moral philosophy has greatly influenced debates about social justice. Her most significant contribution remains her three-dimensional theory of social justice, a model she has developed over many decades. The model began as two-dimensional, exploring concepts of "redistribution" and "recognition" as approaches to move away from identity politics toward cultural politics, and to address social injustices related to concepts such as class, race, sexuality, gender, and so on (Fraser, 2008a,b). Underlying this model is the contention that while discourses of social justice are usually centered on either redistribution or recognition as approaches to resolving social inequities, a combination of the two is required in order to execute equitable approaches to social justice (Fraser, 2008b). As a result of an increasingly globalized world, Fraser would later introduce a third concept, "representation" which attends to matters of political representation, governance and participation. Fraser (2008a) describes the three major forms of justice claims (redistribution, recognition, and representation as the "what," "who" and "how" of justice (p. 400).

Fraser's theory of justice has been taken up by educational researchers to understand the principles by which critical literacy offerings can work to achieve participatory parity (Fraser, 2008a) for diverse peoples and groups, and consider how effective different approaches to critical literacy have been in achieving their emancipatory aims. Fraser insists that for justice to be realized, all three dimensions must be attended to. A focus on achieving one component while necessary, is also insufficient. In literacy education, this

means that equal access to education funding and resourcing (for instance quality texts) while important, cannot on its own bring about justice. This means that a literacy policy focus that relies on redistributive justice is inadequate unless attention is also afforded to the recognition of students' and communities' cultural and social heritage, knowledges and ways of being; as well as providing students or communities with genuine opportunities for partnership in decision-making about literacy. We now turn to explain how viewing critical literacy through Fraser's family of claims reveals teachers' efforts and progress toward social justice agendas.

Redistribution: the "what" of critical literacy

Redistribution refers to the commitment to ensuring all students have access to resources that will enable them to lead good lives. Conceptually, Fraser refers primarily to the distribution of economic and material resources, which is an undeniably important project in redressing injustice. Students living in areas with significant poverty must have access to the resources needed to allow them to gain the literacy skills required to access employment and full citizenship as adults. Fraser (1997) states that economic injustices can be remedied through a kind of political-economic restructuring, such as redistributing education funding or reorganizing staffing to meet the needs of particular groups of students. If cultural injustices are rooted in economic injustices, Fraser (1997) suggests redistribution as a strategy to address injustice.

A range of scholarship that draws on sociological and anthropological works to explain how literacy is implicated in the perpetuation of structural inequities through unequal access to economic capital and knowledge been published over recent decades. Oakes' (2005) *Keeping Track: How schools structure inequality* explored how schooling in capitalist societies functioned as a technology for producing a compliant workforce, willing to accept economic inequities, unequal access to knowledge, and hierarchical divisions in education and employment. Oakes' work drew attention to the uneven access to different forms of literacy within schools, and illustrated how schooling was structured for injustice.

Anyon's (1981) *Social Class and School Knowledge*, also examined how injustice is perpetuated through differential access to curriculum knowledge. Anyon used Marxist theoretical categories to explain how scripted, low-intellectual quality literacies and a focus on compliance offered to working-class and minority students created lasting patterns of inequity. Anyon's work has been taken up by scholars such as Luke (2010) who have argued that critical literacy, and the distribution of equal access to quality pedagogies must be afforded to all students, not just those in elite schools, or affluent suburbs.

Teacher-researchers such as Pennell (2019) have used critical literacy (and critical mathematics) to spark curiosity among students about matters of redistributive justice. Pennell's work documents the inquiries of undertaken by one group of her middle school students as they explored news articles about school funding and student achievement. The class had begun by reading news articles, checking them for legitimacy, and asking questions such as "who has power?" (p. 22). Bringing together critical maths and critical literacy, she reports that groups of students created presentations based on their findings:

[one group] learned that school funding was not the same by state or even city. As private school students, this was not something they had ever needed to consider and gave them new insight into educational issues on a national scale (p. 22).

Education researchers and teachers have also considered the distribution of knowledge in their approach to critical literacy. Equal access to knowledge (as a form of capital that must be fairly distributed to ensure parity of participation), being a discerning and critical consumer of multimodal texts is an increasingly essential skill. Critical literacy has provided teachers with a framework for teaching students to question texts, and to consider the proliferation of untrustworthy material that exists both online, in the media, and in wider textual spaces. Nicole Cooke's (2018) work is an example of how critical literacies can be used to detect both misinformation (information that is incomplete, partial, ambiguous), disinformation (information contains deliberate falsehoods), and to question power structures and cultural biases. From texts on social media to images that have been digitally edited and online videos, her work illustrates how online information is often viewed as being universal, despite it frequently "reflect[ing] a culture of whiteness and sensibilities that are distinctly Western, masculine, and homogeneous in regard to notions of religion, progress, and modernity" (p. 37). She provides an example of a widely tweeted photograph of Rosa Parks, along with a claim that Parks played a role in ending racism as part of the US Civil Rights movement. As Cooke points out, a critical reading of this text allows us to see this tweet as a micro-aggression in that it is underpinned by a worldview that racism no longer exists. Her work draws attention to the role that librarians can play helping students to develop critical digital, media and visual literacies in an age where the internet dominates how many students access information.

Reflecting on the education of Indigenous students in Australia, Luke (2018) considers distribution in terms of "the curriculum question: which selective traditions should shape what will count as literacy, which texts and discourses, literacy practices and events will be codified and transmitted in schools, in whose interests, with what material and discourse consequences?" (p. 229). As Marnie Shay and Judi Wickes (2017) point out, counter-narratives, (such as their own stories, as two Indigenous Australian women) are an important way of disrupting racism, and valuing a diversity of experiences and perspectives. They write that, "the absence of critique and discussion about how constructs of race and issues of racism are so deeply entrenched in our experiences in educational institutions is a marker for how limited our progression as Indigenous Australians are" (p. 112).

Recognition: the “who” of literacy

Recognitive justice takes into account how diverse peoples, standpoints and knowledges are recognized in literacies. This component of Fraser’s model raises the question of “whose knowledge” is foregrounded and whose is marginalized in literacy education. Fraser (2009) noted that “[P]eople can also be prevented from interacting on terms of parity by institutionalized hierarchies of cultural value that deny them the requisite standing: in that case they suffer from status inequality or misrecognition” (p. 16).

Fraser (2003) contends that parity of participation requires a combination of material (distributive) and social (recognition) approaches to addressing injustices. Fraser labels the material as the “objective condition” of parity of participation, and refers to ensuring that independence, voice, and participation are made certain by material distribution, allowing subjects to interact on par with other members of society as peers. Equity in achieving social regard is referred to as “intersubjective condition” with regard to participatory parity. Thus, institutionalized patterns and norms that marginalize some categories of people and privilege others, as well as those that fail to acknowledge difference or ascribe excessive differences to groups, are impeded to ensure parity of participation.

The question of whose knowledge is seen to be a “legitimate” part of literacy curricula, and whose knowledge is absent is important, as scholars such as Luke (2018), Apple (2014) and others have established by examining the texts and curricula used in schools. These forms of knowledge are based on a selective tradition, in which the dominant culture reproduces itself by teaching students what is valued, while oppressing alternate forms of knowledge. Subcultures and diversities are often invisible within these school-based texts, which represent a narrow range of perspectives, histories and traditions. For instance, Indigenous peoples, girls, LGBTIQ+ peoples and immigrants have often been invisible in the texts used in western schooling. Unproblematized, the use of these texts privileges the knowledges and literacies of dominant cultures, constructing them as a natural, homogenized way of thinking, being and doing.

McGraw and van Leent (2018) examination of the Australian Curriculum for Senior Secondary English, for instance, used thematic analysis to establish the extent to which diverse sexualities were represented within these texts. While the majority of texts did not were not readily apparent as representing LGBTIQ+ characters, they showed how books such as Fitzgerald’s *The Great Gatsby* and Shakespeare’s *Twelfth Night* can be taken up in ways that resist heteronormative assumptions about protagonists. As the authors point out, both text choice, as well as how teachers engage with texts, are important in bringing about justice for LGBTIQ+ diverse students, families and teachers. Text selection, and the visibility of marginalized groups such as LGBTIQ+ students and families has also been examined in early and middle years school contexts, showing how even young readers and viewers can and must be visible for justice to be achieved.

In practice, pivoting toward recognitive justice in literacy has sometimes proven to be difficult; first, because there is a risk that tokenistic inclusion of minority views is sufficient to constitute recognitive justice; and second, because hegemonic views about history, culture and ideology can be deeply entrenched in policy and media discourses. Fraser (2005) also draws attention to the risks of recognitive justice in her writing. Describing the politics of identity and the struggle for recognition, she points out that “routes such struggles take often serve not to promote respectful interaction within increasingly multicultural contexts, but to drastically simplify and reify group identities. They tend, rather, to encourage separatism, intolerance and chauvinism, patriarchy and authoritarianism” (p. 108). Calling this the problem of reification, Fraser explained how this approach toward recognition does little to dismantle structural injustice.

Adopting a critical stance that challenges official texts can draw attention to the ways in which official knowledge is implicated in power, justice and the silencing of marginalized groups, such as those within the LGBTIQ+ community. Other scholars such as Jeffries (2019) have examined how invisible norms of heteronormativity are passively maintained when texts such as the film *Gayby Baby* (Mars and Newell, 2015) are excluded in order to meet the demands of conservative stakeholders. *Gayby Baby* is a documentary film that follows four children with same-sex parents that was produced as a resource for teachers, yet led to a “frenzy” (Jeffries, p. 80) and ultimately, a ministerial decision to prevent a planned showing of the film at an Australian school. Links to Fraser’s (2005) problem of displacement, in which struggles for recognition can lead to further marginalization are apparent, with Jeffries’ work showing the complexities of critical literacy. Jeffries’ examination of the conservative commentary and discourses that were unleashed following the inclusion of *Gayby Baby* in a school shows how heteronormative ideals are imbued in school literacies, and how questions of recognition can further marginalize.

While access to officially sanctioned forms of literacy through the redistribution of economic capital has been assumed to lead to more socially just outcomes, the theoretical contributions of Pierre Bourdieu have been used to illustrate how cultural and social capitals also reproduce inequality. Bourdieu’s concept of linguistic capital (an embodied form of cultural capital) illustrates how literate practices and knowledges are acquired through socialization in families and communities, marking students and families as either part of the dominant class, or not. Because schools and education systems value some forms of linguistic capital over others (typically, assigning a symbolic power to dominant, middle-class language), significant educative and symbolic benefits can be accrued by those who possess the desired linguistic capital. Bernstein’s concepts of elaborated and restricted codes similarly explain how literacies are transmitted through families, which means children of working class families who possess different literate practices to those valued by the middle and upper class are subject to ongoing injustices.

While literacy is often assumed to be an equalizer that has the power to reduce inequality, these theorizations have been used by education researchers to show how literate practices therefore signal group membership (for instance, being the child of a working-class family), and can perpetuate exclusion, inclusion; domination and submission in schools. Critical literacy inquiry has been

taken up by teachers as they work with students from diverse backgrounds, including those for whom Standard English is not their first language or dialog. The theoretical work of Bourdieu has been used to highlight how the distribution of knowledge has been restricted by unequal access to educational opportunities. Take for example Souto-Manning's (2009) work with a young student who spoke using African-American Vernacular English [AAVE], for instance showed how the focus in early years' classes on teaching and communicating in Standard American English led to frustration and exclusion from learning. Critical literacies offer an alternate approach in which teachers and students are encouraged to trouble official knowledges, and to consider how these knowledges work to authorize the knowledge of some students and communities over others.

Luke (2018) explains that redistributive justice, as it relates to "fair and equitable access to dominant knowledge structures and conventional literate practices that are requisite for further and higher education, and for sustainable economic and social participation" (p. 11) requires an engagement with the Audre Lorde's concept of the "master's tools" (p. 11). Lorde (1984) writes that "the master's tools will never dismantle the master's house. They may allow us temporarily to beat him [sic] at his own game, but they will never enable us to bring about genuine change" (p. 112). That is, the tools that have been used to oppress, such as access to hegemonic, canonical knowledge, can be used to further critique and dismantle the power relations that have oppressed and pathologized cultural minorities.

Representation: the "how" of curriculum justice

Reframing teachers from being "experts" who are equipped with knowledge about literacy instruction that precludes students or communities from having an input into what is learned, or whether important and locally relevant questions of power and injustice are taken up in the discussion of texts. Fraser (2009) asks, "By which criteria or decision procedure should one resolve disputes about the "what" and the "who?" (p. 54). Teachers who have taken up critical literacies have adopted an explicit stance that takes democratic practice into account in their classrooms.

The final aspect of Fraser's three-dimensional model of social justice is representation. This element of social justice relates to procedures of representation and community membership and governance and the related injustice is misrepresentation (Fraser, 2008b). Fraser (2008b) associates representation with "social belonging, and thus determining who counts as a member, the *political* dimension of justice specifies the reach of those other dimensions: it tells us who is included in, and who is excluded from, the circle of those entitled to a just distribution and reciprocal recognition" (p. 278). Therefore, representation contributes to the politics of belonging, giving clues as to how power functions. Critical literacy that tackles issues of representation therefore relates to an examination of who has a voice equal to others, in schools, public debates, the media and who does not. Fraser's point that misrepresentation is characterized by political decisions and boundaries that prevent participation in governance and decision making. In a classroom, for instance, the exclusion of Indigenous elders and community from making decisions about literacy has been taken up through participatory teacher-researchers.

For Fraser (2008b), institutional and social practices and purposes must be examined in ways that question taken-for-granted assumptions and challenge the "deep grammar" (p. 23) of justice. Her principle of participatory parity requires that "all interlocutors must, in principle, enjoy roughly equal chances to state their views, place issues on the agenda, question the tacit and explicit assumptions of others ... and generally receive a fair hearing" (Fraser, 2009, pp. 93–94). For instance, while decisions about literacy curriculum, pedagogy and assessment are often framed as being the responsibility of literacy "experts," policy makers and educators, taking a critical literacy stance means questioning these standardized formations. Comber's (2016) work with teacher-researchers in Australia illustrate how these shifts in power-sharing can work in a classroom. Teacher Helen Grant's work alongside an artist-in-residence and recently-arrived refugee students in her class in to provide students with meaningful opportunities to make decisions in how they approached a literacy task. The students ultimately created a powerful film called Sudan that repositioned students from lacking the literacies typically considered essential to succeed in school (for instance, proficiency in Standard Australian English), to experts with significant prior knowledge. This approach of sharing decisions, and teachers learning from and alongside students and communities has been documented by others such as Vivian Vasquez (2016). Developing a critical inquiry stance and a curiosity about issues of justice requires teachers to think about their own privileges and blind spots in their approach toward the teaching of literacy.

As Apple (2014) notes, as he reflects on the social construction of knowledge, and who controls knowledge:

Take schools, for example. For some groups of people, schooling is seen as a vast engine of democracy: opening horizons, ensuring mobility, and so on. For others, the reality of schooling is strikingly different. It is seen as a form of social control, or, perhaps, as the embodiment of cultural dangers, institutions whose curricula and teaching practices threaten the moral universe of the students who attend them (p. 46).

A tool for action: students and teachers as social-justice advocates and activists

Literacy has been the focus of political attention in many countries across the globe over recent decades, with convergence of education policies that have prioritized basic skills literacy pedagogy, curriculum and standardized assessment. The assumption that literacy is inherently apolitical, serves to perpetuate hegemony by privileging the knowledges, practices, languages and values of dominant groups at the expense of marginalized groups. The rise of neoliberal practices that use literacy data collected through

high-stakes, large-scale testing has put teachers, schools and education authorities under significant pressure to orient their attention toward the literacy “that counts.” While this meritocratic approach is often touted as a means for ensuring fairness, through ensuring all students are tested using standardized instruments, the result has often been a standardization of texts, and pedagogies that do not engage with critical questions. In contrast, critical literacy provides all students with an opportunity to engage in substantive conversations about a range of issues—such as racism, homophobia, sexism, ableism and climate change—and to consider their own role in bringing about socially just futures across the dimensions of redistribution, recognition and representation.

Teachers working toward social justice by adopting a critical literacy stance can not only be active in their own work, but also, can also spark children and young people’s sense of activism. Linter’s (2010) work using children’s literature to teach critical geographic awareness is an instructive example. His work shows how critical textual analysis can be used to develop students’ understandings of human impacts of the environment, and how these understandings can be furthered through ongoing discussion of “meta-issues” (p. 18) such as climate change. He suggests that it is through these discussions that students might be prompted to “think critically about themselves and their world and the relationship between the two. It also encourages them to ask, ‘What can I do about it?’” (p. 18).

The use of theoretical frameworks that underpin critical literacy, such as queer theory, decolonization and critical race theories, or by drawing on the scholarship of Freire, Luke, Janks and others has increasingly been used to encourage both teachers and students to think beyond the boundary of the classroom, and to develop a critical consciousness toward justice. Summer Melody Pennell’s (2019) use of Janks’ (2000) work that suggests critical literacy take into account four domains (domination; access; diversity; and design) (pp. 176–177) is a useful example. Her work shows how middle-school students can become intentional in their analysis and understanding of events such as the 2014 shooting of an unarmed, Black teenager Michael Brown at the hands of a White police officer. Following the work of three activists who founded the Black Lives Matter Movement gave both teachers and students time to be intentional in reflecting on and analyzing textual accounts such as media reports. Ultimately, Pennell (2019) reports that they “became better allies for racial justice” by having the opportunity to talk about and understand racism, even if they had not experienced it themselves. She notes that, “This unit helped meet our goals of increasing student awareness of social justice issues and encouraging further learning and action. For our young students, this action took the form of speaking to others in the school community and paying closer attention to news stories they watched with their families. Social justice is a constant commitment and practice, one that we worked to foster for young learners through teaching about the tragic death of Michael Brown” (p. 75). In this way, critical literacy became a tool for both teachers and students to learn about the experiences of others, and to become better allies and advocates for social justice. Given the increasing demands created by standardized curricula and assessment, finding space for teachers to be active and autonomous in working toward social justice aims is important.

Conclusion

Given the rise in education policies in many countries that have prioritized standardization of curriculum, assessment and pedagogy, many primary and secondary teachers have looked to critical literacy as a means of bringing about social justice through the act of teaching. In an interview conducted in 2017, Luke said that “Over the long term, my sense is that critical approaches to curriculum are embodied in many teachers’ dispositions—that is, once they and their students are engaged with critical, inquiry-based, dialogic and constructivist work around the formation of knowledge and truth, text and discourse, writing and image, field and discipline, there’s no going back” (Luke, 2018, p. 302).

Using Fraser’s model allows educators to understand injustice as multidimensional so they might reflect on how they are addressing different families of justice claims through critical literacy. The political, cultural and material events of recent years has created a sense of urgency for change, as evidenced by global movements that seek to address colonial and racial injustice, economic justice, justice for women and LGBTIQ+ people. However, the enormity of political upheaval has also left many feeling despondent. We therefore end with the words of prominent scholar, Allan Luke, as he reflects on the evolution of critical literacy, and advises us that:

... consider what our generation experienced in the aftermath of 1968, when our hopes were dashed, friends and colleagues jailed and leaders murdered, while violence raged on in Vietnam and on city streets. This is not a time for despair. This is your generational challenge as educators, scholars and activists. It is game on.

Luke (2018, p. 19).

When social justice is framed as a multidimensional concept, simple solutions to injustice are not plausible. Social transformation and a recalibration of how privilege is understood and dismantled can occur through a commitment to critical literacies that retain a strong focus on multiple aspects of justice—representation, redistribution and representation.

A Counterstory of Critical Literacies, Social and Cultural Justice

We have colloquially titled this entry *A Counterstory of Critical Literacies, Social and Cultural Justice* and, with the help of Dr. Jodene Morrell, I have attempted to weave together a narrative of 30 years of life as a student, a scholar, a teacher, and a writer of critical literacies for social and cultural justice across our most historically vulnerable populations (the remainder of the article will use the personal pronoun “I”). We are indebted to the editors of this volume for encouraging us to draw on our autobiographies as we engage key concepts in the critical discourse of global education. Far too often for African descended postcolonial subjects, our personal voice, our “I”, is muted under a guise of distance and objectivity. This distancing of the subject from the production of knowledge is not consistent with the critical literacy tradition I am charged to discuss. It feels far more authentic to write about critical literacy studies in the tradition of personal voice and agency.

As I grow older, I find it increasingly difficult (and unethical) to separate my critical autobiography from my critical scholarship. I am the work that I do and I am who I am because of the words I have read and written and because of the students I have taught and loved and learned so much from and the academic and social movements I have been privileged to participate in over these past 29 years. In the spirit of the critical race methodological tradition of counter storytelling (Crenshaw et al., 1995; Bell, 1992; Solorzano and Yosso, 2002), this article attempts to narrate the biography of my research and praxis in critical literacies and social justice as a microcosm of larger scholarly and social movements that I hope to illuminate as well.

How I found critical literacy studies

Why Critical Literacy Studies? The first time I pondered this question was almost 30 years ago. I was a junior in the University of California system dropping my Economics courses and trading them in for our English core and a fat *Norton Anthology of British Literature*, one I still possess. I still find myself asking this question of why. Why would one exit a promising career in finance? Why study and teach languages that we speak naturally from birth? Why join a discipline that, at times, pretends that we members of the African Diaspora have nothing to contribute? And why, in a time of global competition and technological advancement, should anyone be left alone to stare at the clouds and contemplate Keats and Tennyson when they could use their time far more productively? As a member of the presidential team of the National Council of Teachers of English (NCTE) from 2011 to 2015, I was asked these and similar questions directly from staffers, senators, and congressional representatives as I sat in their plush DC offices on our annual Advocacy Day.

“The two biggest problems facing the black community are too much poverty and too little self love”- Cornel West

While there are many places from which I could begin to formulate a response, in preparing this text I was drawn to a quote from Cornel West, an American philosopher I discovered at this very moment in my life. The day was April 29, 1992 and, after an American jury found the officers videotaped beating Rodney King not guilty, Los Angeles was burning (and not Ferguson, Louisville, or

Minneapolis of the 2020 movement) and I had just turned 21, having met Jodene (we have been married now 26 years) only 5 days prior. I and my Southern California classmates dropped everything and took to the streets. For three long days and nights.

I returned to my coursework different, somewhat liberated, exhausted, somewhat devastated and in search of a different pathway forward. I turned to a cassette tape sent to me by a friend of a talk delivered by Professor West to students at Bowdoin where he began with the quote above. The talk, essentially a precursor to his now much acclaimed book *Race Matters* (1993), pointed me to pedagogy and literacy studies and away from the JD-MBA applications that adorned my Southern California dorm room. For, in critical literacy, I found my own pathway toward self love and meaningful cultural production. After 30 years, I am still here, and I am happily here. At the risk of sounding sacrilegious I must say that it was critical literacy studies that saved me. I am here because I continue to place critical literacy at the forefront of a pedagogical praxis that can intervene in the lack of self-knowledge, and self love, demanded for active citizenship.

My research and pedagogical philosophy begin with an understanding that any empowering literary or literacy practices must affirm all people as fully human and draw upon the literary and cultural artifacts that most profoundly reveal their subjective existential experiences and their historical and material realities. Toward these ends I have examined the literary, linguistic, and literate practices of ethnic minorities and other historically marginalized groups, particularly as they relate to participation in counter-hegemonic literary production, youth popular culture, and local community life. Advocating for the intellectual merit of these oft hidden or degraded language and literacy practices and the cultural traditions in which they are situated, I have investigated transformative literacy pedagogies inside of literacy classrooms and in out-of-school spaces that facilitate textual empowerment, literary production, and academic engagement.

1. I am interested in how literacy is taught, how it is engaged; the work that teachers and students do together in literacy classrooms, especially work that promotes self love and social justice.
2. I am interested in the literature that is written for and consumed by children and adolescents. I am interested in how this literature is read and reacted to and how these readings and reactions constitute a praxis of critical literacy
3. I have an interest in the African Diaspora as an imagined community—its literature, its popular culture; its engagement; its critique, its resistance, its plurality; its cacophonous polyvocality; its beauty, its power, its joy—its agency, its undeterred presence. I'm also interested in making the African Diaspora knowable and tangible for present and future generations
4. As a doctoral student attending the University of California at Berkeley in the 1990s, I studied the cultural theory of Raymond Williams, Stuart Hall (Hall, 1997), and John Storey and became interested in popular culture as a contested space; a simultaneous space of resistance and social construction. How do youth navigate the discourse of popular culture? And what are the core tenets of what Doug Kellner might call a critical media pedagogy? How are youth taught to inhabit media culture and how do they use media to educate others?
5. I am also interested in how nondominant communities acquire and utilize critical literacies for social action.

Methodologically my work has drawn upon a New Literacy Studies-inspired ethnography of communication and what Norman Fairclough terms a critical discourse analysis. Linguistic anthropologist Shirley Bryce Heath's *Ways With Words* (1983) explores the literate lives of working-class African Americans and whites in the Piedmont Carolinas. Heath analyzes literacy events, which she defined as any occasion in which a piece of writing is integral to the nature of participants' interactions and their interpretive processes. Subsequent theorists in the New Literacy Studies (Brian Street, David Barton, Mary Hamilton) have also advocated the study of the literacy events of members of marginalized subcultures. Barton and Hamilton (2000), for instance argue that it is the work of cultural theorists and ethnographers in the NLS tradition to derive new literacy practices from the study of contemporary (often digitally mediated) literacy events. These scholars have informed my own work even as I push upon the constructs of literacy. The conceptualization of the term, I argue, is central to the work of the student of culture and discourse. We cannot excavate or document what we are not trained to look for. In this vein I have worked to expand the notion of literacy events to accommodate traditional textual practices as well as those that accompany participation in youth popular culture and new media literacies.

Employing an NLS framework, I have conducted a series of ethnographic studies exploring the possible connections between criticalist pedagogies of popular culture and the development of academic and critical literacies in classrooms serving historically vulnerable student populations. For example, I have conducted studies that investigate the potential of drawing upon youth engagement with hip-hop culture to teach critical reading, literary analysis, and the production of expository and creative writing. I have investigated the uses of court trials to teach argumentative writing in secondary English classrooms. I have explored the uses of film critique as a bridge to literary analysis, and I have investigated how critical media education can empower youth as consumers and producers of media. For example, I have documented the ways that young people can be taught to decipher negative and stereotypical images in popular media and I have also documented the process involved in young people becoming producers of short documentary films covering issues of inequality in their schools and communities. Much of my early work along these lines was published in my second book, *Linking Literacy and Popular Culture* (Morrell, 2004).

I have endeavored in my scholarship to articulate a grounded theory of critical literacy education that is culturally and socially responsive to the lives of today's youth, that develops academic literacies and facilitates academic achievement, and that is rooted in the systematic inquiry of classroom practice. My work has targeted diverse classrooms in historically underserved schools, where students' inabilities to access academic content leads to severe educational, social, and political outcomes. Toward these ends, my research has demonstrated that innovative pedagogical practices can increase student engagement and increase youth academic literacy development and academic achievement.

I have been interested in life in formal literacy classrooms and, particularly, how African Diaspora literatures and popular cultural artifacts are appropriated inside of literacy classrooms as sources of engagement, critical consciousness, and social action. These include more traditional texts such as novels, poems, and plays, but I have also been interested in the uses of popular culture (i.e., critical hip-hop, spoken word poetry, film, television, corporate and social media outlets) (Morrell et al., 2013).

I have also been interested in the textual and cultural production inside of literacy classrooms as students participate in community-centered research and outreach projects. I conducted a series of critical ethnographies where I followed high school and college students over a 12-year period from 1999 to 2011. I was interested in how students from historically nondominant backgrounds were able to utilize traditional and multimodal genres to distribute academic research to multiple audiences. These studies, in the tradition of the ethnography of communication, documented the literacy events over a multi-year trajectory as they related to textual consumption, research reports, essays, critical memoirs, spoken word poems, hip-hop songs, a hip-hop opera, plays, and documentary scripts (Morrell, 2008a,b; Mirra et al., 2016).

Critical Literacy and Urban Youth: Pedagogies of Access, Dissent, and Liberation (Morrell, 2008a,b) offers an interrogation of critical theory developed from my work with young people in classrooms, neighborhoods, and institutions of power. Through cases, an articulated process, and a theory of literacy education and social change, I attempt to extend the conversation among literacy educators about what constitutes critical literacy while also examining implications for practice in secondary and postsecondary American educational contexts. This book is distinguished by its weaving together of theory and practice. I begin by arguing for a broader definition of the “critical” in critical literacy—one that encapsulates the entire Western philosophical tradition as well as several important “Othered” traditions ranging from Postcolonialism to the African-American tradition. Next, I look at four cases of critical literacy pedagogy with urban youth: teaching popular culture in a high school English classroom; conducting community-based critical research; engaging in cyber-activism; and doing critical media literacy education. Lastly, I return to theory, first considering two areas of critical literacy pedagogy that are still relatively unexplored: the importance of critical reading and writing in constituting and reconstituting the self, and critical writing that is not just about coming to a critical understanding of the world but that plays an explicit and self-referential role in changing the world. I conclude by outlining a grounded theory of critical literacy pedagogy and considering its implications for literacy research, teacher education, classroom practice, and advocacy work for social change.

I have incorporated African-Diaspora popular cultural studies and postcolonial studies into my conceptual framework for critical literacy pedagogy and praxis. One of the criticisms of critical pedagogy is that, in focusing on issues of class and social reproduction, it ignores or downplays the significance of race to experiences in America’s schools. Any examination of academic achievement globally reveals gross inequities in achievement for members of different racial groups, even when class is constant. My work has drawn upon African Diaspora Studies to theorize pedagogies of ethnic empowerment as well as academic achievement. For instance, in a chapter published in the book *Teach Freedom: Education for Liberation in the African-American Tradition*, I examined the role of rebel ethnic music in promoting universal critical literacy, paying particular attention to the relationships between critical hip-hop and roots reggae music and the literacy practices of African-Americans and Afro-Caribbeans (Morrell, 2008a,b). I have also examined the possible intersections between postcolonial theory and the development of teachers across the P-16 pipeline who simultaneously prepare their students for the worlds of professional employment and engaged citizenship and cultural production for racial and social justice in the Americas.

Toward a critical pedagogy of English language, literature, and literacy

I join a chorus of scholars like Carol D. Lee, Robert Scholes (Scholes, 1998), Geneva Smitherman (Smitherman, 1999), Keith Gilyard, Gerald Graff, Anne Gere, and Arthur Applebee who have been strong proponents of an increased critical pedagogical and critical literacy focus in English studies. These scholars span the Anglophone world from the United Kingdom and Canada to Australia, New Zealand, Jamaica and the Anglophone Caribbean to the United States. My ideas about the critical pedagogy of English have been largely formed by Paulo Freire (1970) and other adherents of what we have been calling critical pedagogy such as Antonia Darder (Darder, 1991), Peter McLaren (McLaren, 1989), Carlos Torres (Torres, 1998), and Angela Valenzuela. Paulo Freire, a Brazilian literacy educator and education advisor to the World Council of Churches believed that education held the potential to enhance conditions of either oppression or liberation. In *Pedagogy of the Oppressed*, written while in exile at Harvard in the late 1960s, Freire identified banking education as the primary method by which educational institutions maintain oppressive ideologies. According to his banking metaphor, schools or educational institutions treat students as empty repositories waiting to be filled by institutionally sanctioned knowledge, even if possessing that knowledge was detrimental to students’ sense of self.

Freire argued instead for a problem-posing education, an education rooted in the existential experiences of the people, in which they explored their own immediate surroundings and, in an attempt to become more present in understanding and reshaping their own reality, develop important academic and critical literacy skills.

In *The Art of Critical Pedagogy: Possibilities of Moving from Theory to Practice in Urban Schools* my co-author Jeff Duncan-Andrade and I (Duncan-Andrade and Morrell, 2008) explore critical pedagogy and its practical applications for the Teaching of English. It addresses two looming, yet under-explored questions that have emerged with the ascendancy of critical pedagogy in the educational discourse: (1) What does critical pedagogy look like in urban secondary English classrooms? and (2) How can a systematic investigation of critical work enacted in urban contexts simultaneously draw upon and push the core tenets of critical pedagogy? Addressing the tensions inherent in enacting critical pedagogy—between working to disrupt and to successfully navigate oppressive

institutionalized structures,—*The Art of Critical Pedagogy* seeks to generate authentic internal and external dialogs among English educators in search of literary texts and classroom practices that contribute toward a more socially just world.

My current manuscript, *Critical Pedagogy and Cultural Studies in Literacy Education*, considers the potential of conceptual and empirical work in critical pedagogy and cultural studies to inform, confront and transform many of the persistent challenges we presently face in literacy classrooms. The book begins with an examination of the historical antecedents of critical pedagogy, both from the Western philosophical tradition and “Othered” traditions such as the African-Diaspora and Latin American traditions and Postcolonialism. The book will then examine the theory and research of critical pedagogists such as Paulo Freire, Sonia Nieto (Nieto, 1992), Carlos Torres, Peter McLaren, Henry Giroux (Giroux, 1992), Antonia Darder, and bell hooks (hooks, 1994). The second half of the book focuses on cultural studies and, in particular, the critical uses of popular culture in secondary and college English classrooms. Examples include critical hip-hop and spoken word poetry, film, television, mass media consumption and production, youth participatory action and their implications for transformative work with the post-millennial generation.

I am joined in this work by scholars such as H. Samy Alim, Maisha Winn, Django Paris, Michele Knobel, Colin Lankshear, Alan Luke, Carmen Luke, Donna Alvermann, Kris Gutierrez, Mimi Ito, Jennifer Rowsell and many others who have shown the brilliant ways that youth engage popular culture as well as the exciting academic and social outcomes that accompany critical literacy pedagogies that engage digital media and youth popular culture. These scholars come from diverse fields like critical linguistics, cultural anthropology, the learning sciences, philosophy, ethnic studies and the educational sciences to explore the language of hip hop (Alim, 2006), sociocritical literacies (Gutierrez, 2008), overcoming digital divides (Morrell and Rowsell, 2020), spoken word poetry in city classrooms (Fisher, 2007), and everyday teen life in the era of digital media (Ito et al., 2019).

Powerful literacy education today and tomorrow

How do contemporary critical literacy scholars and educators build upon the amazing work that has come before? What do we need to risk today to make possible 50 years from now a movement for powerful literacy education? I like to think of beginning with an assessment of who we are at present. When do we begin to recognize, as a field, that we are a multiliterate, multilingual planet, and that one cannot extricate the political enterprise from the formal teaching of language and literacy? If we are not for social justice then we are for social injustice. There is no in-between.

What do we need to do to make tomorrow’s critical literacy education the norm today and not the exception in our classrooms? We need to start a new movement. Children’s Defense Fund President Marian Wright Edelman has often said, “If you don’t like the way the world is, you change it. You have an obligation to change it. Just do it one step at a time” and “Stop talking about what’s not possible.” Nobody has time for us to twiddle our thumbs and be hopeless. So if we don’t like the way things are, we have to become agents of change.

Our work becomes critical when we share it internally through our books, journals and our conference presentations. It becomes critical when we share it through online chats, through social media, on podiums, as part of activism. The best-kept secret in literacy is the daily genius in our primary and secondary classrooms across the globe. What does that genius look like?

Critical approaches to teaching the Africanist presence in literature

In this here place, we flesh; flesh that weeps, laughs; flesh that dances on bare feet in grass. Love it. Love it hard. Yonder they do not love your flesh. They despise it. They don’t love your eyes; they’d just as soon pick em out. No more do they love the skin on your back. Yonder they flay it. And O my people they do not love your hands. Those they only use, tie, bind, chop off and leave empty. Love your hands! Love them. Raise them up and kiss them. Touch others with them, pat them together, stroke them on your face “cause they don’t love that either. You got to love it, you! And no, they ain’t in love with your mouth. Yonder, out there, they will see it broken and break it again. What you say out of it they will not heed. What you scream from it they do not hear. What you put into it to nourish your body they will snatch away and give you leavins instead. No, they don’t love your mouth. You got to love it. This is flesh I’m talking about here. Flesh that needs to be loved. Feet that need to rest and to dance; backs that need support; shoulders that need arms, strong arms I’m telling you. And O my people, out yonder, hear me, they do not love your neck unnoosed and straight. So love your neck; put a hand on it, grace it, stroke it and hold it up. and all your inside parts that they’d just as soon slop for hogs, you got to love them. The dark, dark liver—love it, love it and the beat and beating heart, love that too. More than eyes or feet. More than lungs that have yet to draw free air. More than your life-holding womb ... hear me now, love your heart. For this is the prize.”

Toni Morrison (1987). (Morrison, 1987)

In *Playing in the Dark: Whiteness and the literary imagination* Nobel Laureate Morrison (1993) challenges us to stop averting our gaze to the Africanist presence that saturates American literature. To engage this presence, she argues, should be an act of pure joy for all. Her work, she testifies, is an act of love and joy. It is my hope, my dream that we all learn to love the Diaspora as much as Morrison challenges us to. That regardless of our immediate origins, we see in the eyes, the necks, the hearts and the souls of the Diaspora our own selves, our own pasts, our own possibilities. The Diaspora is big enough for us all! Morrison’s call is echoed by scholars in multicultural education (Jim Banks, Gloria Ladson-Billings, Sonia Nieto, Carl Banks, Christine Sleeter), critical race studies in education (Solorzano and Yosso, Ladson-Billings and Tate) and critical linguistics (Ofelia Garcia, Geneva Smitherman)

to make language and literacy instruction more responsive to the heterogeneity of our student bodies around the world. In what follows I hone in on what this might mean for critical literacy studies to more meaningfully engage the African Diaspora.

As profoundly as literacy studies have shaped my academic trajectory over the past 30 years, the African Diaspora has also formed (and transformed) me ontologically as well as intellectually. James (1989) describes the process of revolution as the process of people finding themselves. Part of my ontological development has resulted from my own search for an African Diaspora that was not very present in my formative schooling experiences. The fragments of the African Diaspora that were present in schooling and often in the larger public discourse did not feel familiar. Nor did they feel powerful.

Through my own travels, readings, and connections with scholars throughout the globe, I have discovered an African Diaspora more present and potent than I could have imagined as a schoolchild or as a burgeoning intellectual. Still, I often wonder as I peruse bookshelves, libraries, and university catalogs, why one has to seek so diligently to find true and authentic narratives of a population that collectively represents more than 20% of the planet. How do we ethically tolerate the academic invisibility and educational disinvestment (at every level including, and maybe most profoundly, at the university level)? More importantly, how do we make amends?

Were it a nation the African Diaspora would be the third largest country on earth, behind only China and India, and ahead of the United States. Taken together Africa and the African Diaspora represent 20% of the world's population. According to UNESCO projections, by 2050 40% of all births will occur in sub-Saharan Africa and by 2100 40% of the world's population could live in or hail immediately from Africa (UNESCO, 2017). This represents a significant and fast growing population that we know relatively little about from a scholarly perspective. What we do know is that the continent has the lowest life expectancies and some of the lowest literacy rates on the planet. We also know that its artists, its heroes, its priests and bishops, its educators, its cultural institutions, and its martyrs are largely unknown and understudied by the Western world. Hierarchies of knowledge, legacies of enslavement and exploitation, and academic structures that lean toward Europe have prevented the serious study of the African Continent and African Diaspora that are warranted.

Along with colleagues Kassie Freeman and Henry Levin, we developed the African Diaspora Consortium (ADC) realizing that, if we waited for an invitation to do so, one would never arrive. The African Diaspora consortium was created to impact positively the educational, economic, and artistic outcomes and opportunities of Black populations across the African Diaspora. ADC is unique in that it focuses its attention and develops partnerships in countries where African descendants were historically and culturally dispersed during the transatlantic slave trade and/or different migration periods (e.g., the Caribbean region, Europe, Latin America, and North America). By all accounts, there has been a striking lack of research and best practices devoted to dispersed African descendant populations. Yet, logically and intuitively, better understanding comparatively how dispersed populations navigated their locations in different and new worlds while developing art forms as modes of communication, interconnectedness, and education and economic uplift can hold great importance from an economy of scales perspective for countries globally. Increased understanding of both commonalities and differences in experiences as shaped by different immigrant origins and societal practices of their resident societies across nations can provide useful possibilities and outcomes.

Led by Dr. Kassie Freeman, former president of the Comparative International Education Society, ADC seeks to accomplish three main goals: (1) Identify via cross-disciplinary academic research the historic and cultural connections as well as common challenges and opportunities across the Diaspora; (2) Increase educational success and outcomes for African descendant populations at all levels globally, promoting and exchanging learning successes from partner countries; and (3) Utilize literature and the arts as a vehicle to enhance understanding and connectedness as historical and cultural uplift. Our greatest accomplishment to date is the development of academic content focused on the African Diaspora for the Advanced Placement (or AP) Research Seminar offered by the College Board in the US. The African Diaspora content represents the first offering of its kind by the College Board and is available to thousands of classrooms. The content focuses on colonialism, resistance, and everyday cultural practice and invites students of all backgrounds to draw on primary sources, popular culture to develop their own research and action projects related to the global African Diaspora.

Exploring race and justice in America through literature and popular culture

Lee (1993) set the gold standard for incorporating African-American literature and discourse genres into the formal teaching of English in North American central cities that were becoming increasingly African-American. In my own classroom in Oakland, California I was inspired by Lee and others to incorporate Richard Wright's (Wright, 1940) *Native Son* as a bridge to African American languages and literacies in my secondary English classroom. In work with 120 seniors across four sections of senior English I structured a mock trial where Bigger Thomas, the protagonist, would be put on trial. Richard Wright's *Native Son* was nested inside of a larger multimedia themed curriculum dealing with Race and Justice in American society. In addition to the Wright book students watched "A Time to Kill," they listened to popular music that dealt with issues of race in Imperialist society such as Bob Dylan's Hurricane, Bob Marley's Buffalo Soldiers (Marley and Sporty, 1978), and Lauryn Hill's *The Miseducation of Lauryn Hill* (Hill, 1998). The traditional capstone activity was a two-week mock trial although students also needed to develop a social action project. One of the years this became a community newsletter that used student-produced literature, personal narratives, and qualitative research to promote racial healing and, in another year, the students initiated dialogs of mutual understanding with local law enforcement officials.

I amassed a collection of casebooks across four sections of English over a period of 3 years (approximately 500 casebooks) to determine the connection between the oral arguments presented in the trial setting and the quality of arguments made by students in their written analysis of the trial. In the casebooks the students were asked to include: (1) All the questions prepared for the witnesses of their team and scripted responses; (2) All of the anticipated questions to be asked of their witnesses in cross-examination; (3) All of the questions prepared in advance for opposing witnesses in cross-examination; (4) The opening arguments; (5) All notes taken during the trial (trial notes are mandatory); and (6) A 5–7 page summation/analysis of the trial. The case books averaged between 50 and 60 pages. I was very interested in how the inclusion of oral language in the English classroom, and more specifically oral arguments, translated into robust written arguments. I was also interested in how students' discussions of a popular film like *A Time to Kill* would influence their analysis of a text written in the 1940s. My findings indicated that the volume and quality of students' arguments increased and I began to use similar practices in the College Writing course I was teaching at a local university.

Using Langston Hughes' *Dream Deferred* (Hughes, 1994) as a launching text, I designed a project where high school and college students created youth participatory action research projects in response to the poem. One class decided to study the educational and social disinvestments in the nation's young people, what they described as the killing of dreams. This idea of connecting students' lives to dreams deferred became the focal point of campus movements that ultimately became national social movements that remain relevant today. I can still remember one of my undergraduates at UCLA promising the class that, for her final project, she was going to start a national movement. By the end of the term we had witnessed a series of civil disobedience protests in Senate offices and a response from the president of the United States. Another of my students at UCLA ran into then governor Arnold Schwarzenegger at a Starbucks in Santa Monica and informed him of the work of our class. She invited him to class and he, in true Arnold fashion, accepted the invitation and engaged our undergraduates in an honest and robust dialog around issues of equity and social justice. I have been heartened by the role of the study of literature and contemporary popular culture in facilitating dynamic spaces for critical social thought and counter-textual production; and in my own work I study the connections between these literature-based projects and students' academic literacy learning, their identity development, and their involvement in social action.

Critical hip-hop and literacy studies

Literacy studies should concern itself with the study of hip-hop as a critical postindustrial expression of youth culture throughout the African Diaspora. Several notable scholars who have made these connections include: Maisha Fisher, H. Samy Alim, Marc Lamont Hill, Chris Emdin, Emery Petchauer, Lauren Kelly, and Jamila Lyiscott. My interest in critical hip hop in literacy classrooms dates back to the mid 1990s. While heeding the concerns expressed in George Lipsitz's (Lipsitz, 1997) *Dangerous Crossroads: Postmodernism, Popular Music, and the Poetics of Place* about corporatized popular culture as existing in a dialectic tension between co-optation and postcolonial counterhegemony, I was also influenced by Rose's (1994) classic *Black Noise*, where she theorized critical hip-hop as a youth-initiated critique of urban post-industrialism. This view comported with my own reading of hip-hop as a voice of agency and resistance and, through lyricists I was studying at the time like Lauryn Hill, Rakim, and Chuck D, I argued to my less than enthusiastic dissertation committee that hip-hop represented a social theorizing and critical public pedagogy. My aim was to write a study that focused on the poetics of hip-hop, similar to the work of Imani Perry (Perry, 2004) at Princeton University. However, I was unprepared for how much I would be drawn into the pedagogy of hip-hop through my work with the high school students I worked with every day in an East Oakland high school.

Synthesizing literature from critical pedagogy, sociocultural psychology, and cultural studies with popular cultural texts and experiences from actual English classroom practice, I embarked upon a series of studies that explored the critical teaching of hip-hop and other forms of youth popular culture as a viable strategy to increase academic and critical literacies in urban secondary English classrooms. Relying on scholarship which views youth popular culture as a powerful, but oftentimes underutilized point of intervention for schools, these authors discuss the impact of using youth popular culture to reconnect with otherwise disenfranchised schooling populations. I attempt to rebut criticisms associated with the teaching of popular culture by showing how teachers can simultaneously honor and draw upon the sociocultural practices of their students while also adhering to state and national standards. Further, the work hopefully demonstrates the social relevance, academic worthiness and intellectual merit of hip-hop music and culture.

I have taught hip-hop as a period of poetry; as an inspired youth resistance to urban post-industrialism (Rose, 1994). Alongside other periods of poetry such as Elizabethan, Romantic, Harlem Renaissance, and Civil Rights Poetry student research groups compared and contrasted contemporary hip-hop texts with classic poetry texts. They then led an hour presentation/discussion among their peers about the two texts. Students also wrote a 5–7 page critical interpretations of a song of their choice and an anthology of ten poems and presented their poetry to their peers.

Other teachers and members of the larger society perceived many of the students in my classrooms as functionally illiterate and lacking in intellect. These detractors relied on traditional school-based measures (past school performance, test scores) to support their claims and their resultant behavior toward (more like against) these youth. These assessments, however, ran counter to my observations of our students' sophisticated literacy practices that accompanied their participation in hip-hop culture. The same students portrayed as uninterested in literacy would come into our classrooms capable of reciting from memory the lyrics of entire rap albums. They voraciously read popular hip-hop magazines and transcribed song lyrics, and several carried their own rap

composition books. Even those students who were not so deeply involved with hip-hop culture regularly listened to popular radio stations that programmed predominantly hip-hop and accessed magazines and CDs. To tap into this literacy-rich youth cultural activity, we developed a seven-week poetry unit that paired hip-hop texts with canonical works of poetry. The goal of the unit was to play on students' heavy investments in hip-hop to create deeper understandings of school-based forms of poetry. We aimed to help students see the timelessness of the literary themes present in both canonical texts that they were mostly unfamiliar with and some of the music they listened to daily. We made explicit the fact that the literacy skills and knowledge that they exhibited in their interactions with hip-hop texts were not far removed from the skills required to succeed in analysis of poetry. After pairing eight traditional poetry texts with eight rap songs, we divided our classes into groups of four or five students. Each group was responsible for preparing a class lesson on its pair of works. They were given relative autonomy for the form of their presentation, but each presentation was to have the following three elements:

1. Analysis of the literary themes of each work (we gave students a list of common themes but encouraged them to develop others as they saw them emerge in the work)
2. Comparative analysis of the two works (how are the works similar, how are they different, how do the authors use similar or different devices to deliver their message?)
3. Guiding questions for class discussion (we had modeled complex, open-ended questions throughout the year and encouraged students to design similar questions)

In addition to preparing the group presentation, each student was expected to prepare an analysis of the other seven poem/song pairings to participate in class discussions. We had worked hard all year on developing a classroom culture where student participation in dialogs about literary themes was normalized. This, along with the use of hip-hop texts that drew students' attention, made the prospect of out-of-class preparation more likely, as the class came to enjoy challenging and broadening the literary analysis of their peers. While my work has focused on the uses of hip hop in classroom contexts, others have explored the linguistic dexterity of hip hop (Alim, Lyiscott), hip hop as a source of consciousness and activism (Hill, Kelly), and the uses of hip hop in teacher education (Petchauer, etc.). Indeed, #HipHopEd is an amazing community of in-school and out of school artists and educators who imagine uses of hip hop in cultural work with young children and adolescents (Morrell, 2008a,b).

Critical media pedagogies

In the first two decades of the 21st century literacy studies have become increasingly interested in digital media. This makes good sense as the lives of today's youth are saturated with media from television and film, to social media and video games, and the millennial generation spend the majority of their waking lives as consumers and producers of media. This interaction has both positive and potentially harmful effects. On one hand, youth are acquiring sophisticated skills via their media participation that could be useful to transition to academic achievement, professional employment, and civic life in the 21st century. However, major corporations who want to develop loyal consumers and therefore play into the insecurities of young people also heavily influence the media that youth consume. Media are also prone to send negative messages and they reinforce stereotypes and dominant value systems that could have deleterious effects on uncritical consumers.

The power of new media in the lives of young people cannot be denied and, therefore, media education needs to be more effectively implemented into the K-16 English curricula in the United States. Other nations such as Canada and Great Britain have called for media education, but their versions of media education have largely entailed the study of media texts. While this is important, we must recognize the democratizing nature of media as sites of production. And media education has not necessarily advocated a *critical stance* toward media production, nor has it looked at the considerations for historically underserved youth and their relationships toward media, past and present. There are, however, a recent generation of scholars who are looking to hip hop culture (Alim, 2006), film (Morrell, 2004), radio (Soepp and Chavez, 2010), spoken word poetry (Fisher, 2007) video gaming (Gee, 2003), and social media (Ito, 2009) as sites of youth participatory culture (Jenkins, 2009) engagement, agency, and resistance. While still wary of the potentially ill effects of media use, this latter group is much more optimistic about critical media literacy as an act of a critical and culturally responsive approach to literacy instruction.

My work theorizes critical media production among urban youth as a strategy for increasing literacy development and civic engagement. Drawing from a combination of philosophy, critical theory, and empirical research on media pedagogy with urban teens across inside of an inner city high school, I explore the applications of critical media pedagogy across the humanities disciplines noting how everyday teachers and university faculty bring new media into their teaching and the impacts of the new media on students' learning, achievement, and engagement.

I was influenced by the sociology of culture and cultural studies, particularly the work of Raymond Williams and John Storey (Storey, 2018) in thinking about approaches to the reading and re-writing of media found in the critical media pedagogy studies. Cultural theorist Raymond Williams (1995) articulates three components of culture that are essential to any thorough analysis of the subject.

1. *Ideal*, in which culture is a state or process of human perfection in terms of absolute or universal values.
2. According to the *documentary* component, culture is the body of intellectual and imaginative work, in which human thought and experience are recorded.

3. Finally, the third, or *social*, component of culture is a description of a particular way of life, which expresses certain meanings and values not only in art and learning, but also in institutions and “ordinary” behavior.

I am also interested in critical media analysis and youth popular cultural production as acts of counter hegemony. Hegemony, for Gramsci is a political concept developed to explain the absence of socialist revolutions in Western capitalist democracies (Gramsci and Hoare, 1957). The concept of hegemony is used by Gramsci to refer to a process in which a dominant class does not merely rule a society, but leads it through the exercise of moral and intellectual leadership. In this sense, the concept is used to suggest a society in which, despite oppression and exploitation, there is a high degree of consensus and a large measure of social stability; a society where the subordinate groups and classes appear to support meanings which bind them to, and incorporate them into, the prevailing structures of power. Hegemony is organized by those that Gramsci designates as the organic intellectuals.

In this approach, popular culture is seen as a site of struggle between the forces of resistance of subordinate groups in society, and the forces of incorporation of dominant groups in society. Popular culture in this usage is not an imposed “mass culture,” or a “people’s culture,” it is more of a terrain of exchange between the two. The texts and practices of popular culture move within what Gramsci calls a “compromise equilibrium.” Those who look at popular culture from a neo-Gramscian perspective tend to see it as a terrain of ideological struggle between dominant and subordinate classes, or dominant and subordinate cultures. Using a neo-Gramscian analysis, popular culture is what men and women make from their active consumption of the texts and practices of the culture industries. Youth cultures, for example, are able to appropriate for their own purposes and meanings the commodities that are commercially provided. For instance, in popular musical genres such as Reggae and hip-hop, it is possible to have anti-capitalist politics articulated in the economic interests of capitalism. The music may be lubricating the very system that it seeks to condemn. It may exist as an expression of oppositional politics which produces certain political and cultural effects in a form that is of financial benefit to the dominant culture. Cultural theorists must be aware of the simultaneous possibilities of the making of popular culture for subordinate groups. It has the potential of empowerment and resistance, but it can also lead to passivity and consumption of the hegemonic ideals promoted by the organic intellectuals of the dominant class.

More recently, we have expanded the critical media pedagogy work to articulate a new critical theory of multiliteracies that encompasses 4 types of digital engagement: (a) critical digital consumption, (b) critical digital production, (c) critical distribution, and (d) critical digital invention. We make the argument that a new critical theory of multiliteracies needs to account for each of these types of digital engagement but that, ultimately, we must move beyond theorizing our youth as passive consumers or even critical users of digital technologies toward the project of facilitating youth communities of digital innovation (Mirra et al., 2018).

YPAR and critical literacies for social action

There are thirty-five of us huddled in a corner of the Sheraton in New Orleans, away from the presentation rooms, trying to find a quiet place in the half hour or so we have before we present. The high school students pose for pictures with their peers and their teachers. Dressed up in suits, they look like they’re headed to work or church; instead, these high school students are about to deliver a presentation to the American Educational Research Association articulating the research on civic engagement and urban educational reform that they have been conducting for an entire school year. Ten minutes prior to show time we convene in our usual circle. Stragglers amble out of bathrooms tucking in shirts and checking their hair. The seniors step up for our traditional pep talk and offer their words of advice and encouragement. Their use of the collective pronoun reminds me again of what we are capable of creating as a society if we only had the will, if we only paid attention, and if we only fully believed in the humanity of these students and the neighborhoods and families from which they came. Everybody wants to feel a part of something special; everyone wants to contribute. We are dreamers all unless of course, those dreams through time and heartache have been deferred or extinguished altogether.

This brief vignette comes from a presentation to the American Educational Research Association (AERA) by high school students who were participants in the Council of Youth Research, a project I directed for 12 years (1999–2011) where high school students developed Youth Participatory Action Research (YPAR) projects in the neighborhoods and communities of Los Angeles. Our research group has written extensively on the connection between participation in this work and critical literacy development, civic engagement, community transformation, educational policy advocacy, and digital literacy learning.

YPAR is considered a subcategory of Participatory Action Research (PAR) and represents, “a radical shift from traditional research because of *what* it investigates and *who* does the investigating” (Morrell, 2006, pp. 112–113). YPAR is “critical,” “participatory” and “action-oriented” in that it “challenges the hierarchy of knowledge production and changes the relationship of knowledge producers to knowledge consumers” (Morrell, 2006, p. 3). While PAR is not a new research approach to, a critical perspective and approach with youth as the subjects rather than the objects, certainly is.

Morrow and Torres (1995) discuss how participatory action research gained recognition in Latin America during the 1970s through the Symposium of Cartagena on Critical Social Science Research in April 1977 and “the influence of Brazilian educator Freire (1970) who engaged marginalized populations of Brazilian peasants as collaborators, researchers, and activists” (Morrell, 2006, p. 6). His revolutionary pedagogy helped ordinary people develop critical literacy and inquiry skills to address structures of power. The idea of employing inquiry for advocacy is, as Morrell (2006) says, “as old as the tradition of inquiry itself” and reminds us that, “This is important to keep in mind amid contemporary conversations about quality, validity, and rigor in social scientific research” (p. 6).

McIntyre (2000) offered three principles that guide most participatory action research projects: (a) the collective investigation of a problem; (b) the reliance on indigenous knowledge to better understand that problem; and (c) the desire to take individual and/or collective action to deal with the stated problem.

Today there exists a flourishing community of educators who are using YPAR with students to investigate and intervene in social injustices around the world. This is a dynamic and inspiring body of work that can link YPAR work to academic achievement, positive identity development, and community engagement. Cammarota and Fine (2008) edited the first book that specifically refers to this work as Youth Participatory Action Research. I was fortunate enough to participate in that collective effort, which essentially presented this growing movement to the larger critical educational studies community. Scholars such as Shawn Ginwright, Beth Rubin, Eve Tuck, Ben Girshner, Maria Elena Torre, Ernest Morrell, Augustin Romero have produced volumes in the ensuing years that have shaped our understanding of YPAR and its contributions to an educational field that is increasingly interested in engagement, youth production, and social action.

Toward a praxis of universal critical literacy and revolutionary love

Toni Morrison reminds us that, if there is a book that you want to read, but it hasn't been written yet, then you must write it. For those of us in the academy we can take this quote quite literally. However, I would like to consider it collectively as a challenge and an opportunity to further integrate our field with the words and worlds of youth and communities, with media and popular culture, and with the cultural and literary histories of the Anglophonic African Diaspora.

It is my dream that this collective work, this as yet unwritten book, speaks to the silences that have plagued us and to those who have been left searching, in the silence, for recognition, for affirmation, and for historical significance. Yet, I also imagine this collective work as an invitation to all, as a source of celebration, and as a call to become co-participants in the making of bold, robust, and globally representative disciplinary futures. Put simply, the work matters. We matter. When I think of that April, nearly 30 years ago and the call of critical literacy studies, I am humbled by what this field has made possible for me and I am even further humbled by what remains to be accomplished.

Poetry is a much-valued form of expression. For the past 25 years, poetry has opened up possibilities in teaching and learning and expanded scholarship in literacy studies. Three dimensions of this research based on my own inquiry are (a) pedagogy and the politics of poetry, (b) participatory cultures and new media literacies, and (c) youth media and translocal practices. It is also important to discuss emerging lessons about youth poetry and questions that pertain, for example, to trauma-informed literacies and new materialisms in youth studies. For this entry, I have culled together previous writings to illustrate studies. For this entry, I have culled together previous writings to illustrate some relevant perspectives on youth poetry. Lastly, I point to future directions in civic literacies, speculative education, multimodality, and critical research methodologies in further shaping our understanding of youth poetry. My hope is to build on connective threads toward more fruitful conversations.

On pedagogy and the politics of poetry

Given the persisting perceptions and treatment of young people in school and society, particularly young people of color from marginalized communities, it has been crucial to turn to youth themselves to understand the ways in which poetry mediates their everyday realities. My earlier studies focused on how young people draw on poetry as a medium to help make sense of their social words, including the persons they are becoming and the desires they have for their present and future lives (Jocson, 2006a,b). Tapping into the power of poetry and what young people have to say renders possibilities for educators, youth advocates, cultural workers, researchers, and policymakers alike. In my work in classrooms and community settings, I have witnessed the influence of poetry and how poetry can be used as a pedagogical tool to expand views about young people and youth cultures, inform academic and critical literacies, and challenge static notions of teaching and learning (Jocson, 2008). Examples are detailed in my book *Youth Poets: Empowering Literacies In and Out of Schools*, which sheds some light on treating poetry as a social practice among youth to reveal complexities of teaching and learning in the context of a university-school partnership through June Jordan's Poetry for the People (P4P). Central to P4P's pedagogical approach, then and now, has been to support youth's participation in poetry writing and to create opportunities for critical literacy and civic engagement.

Writers all over the world have felt a kinship with poetry and at times have utilized poetry as a democratic means to respond to political upheavals. Poetry pushes boundaries to raise popular consciousness by speaking truth to power. It serves as a medium for truth-telling, a vital element in political activism and social transformation. In the US poets and writers and their historical legacies have been a driving force in cultural and social movements. Youth poets, in particular, are at the center of these movements and over the years have increasingly participated in literary arts organizations where writing workshops and public performances help to showcase their written-verbal artistry and community activism (Jocson and Rivera, 2010; Kim, 2013). In my studies, I have seen youth's increasing interest in poetry within the broader contexts of their lives to shape what and how they write, for whom it matters, and with whom they share.

With influences of popular culture, poetry has become a more inclusive medium of expression in schools and carries with it historical legacies of African oral traditions and storytelling. In the 1960s and 1970s, for example, poetry as a black art form played a significant role in helping to disseminate the politics of the Civil Rights Movement. Poetry readings served as esthetic spaces for sharing messages of hope and struggle. Poetry advanced the Civil Rights Movement through public performances within institutional settings and local community venues, including spoken word and open mics. Poetry's revival in the 1990s and into 2000s drew upon earlier periods of the Black Arts Renaissance and today has reached global audiences. In the field of education, scholars have offered a range of perspectives on the power and potential of youth poetry (Fisher, 2007; Sablo Sutton, 2004; Watson, 2013; Weinstein and West, 2012). With the advent of new technologies, poetry has exploded from the page through chapbooks and zines, radio broadcasts, television shows and commercials, films, podcasts, and various other social media outlets. There is no doubt

that poetry has (re)emerged stronger than ever and has become more publicly accessible. It is this cultural phenomenon to which I now turn.

On participatory cultures and new media literacies

Today's creative expressions blur the lines between youth cultural production and participatory politics. Indeed, there are myriad ways of participating in civic life. It is no longer a surprise that many young people are making videos, taking photographs, creating websites, blogging, assembling mash ups, and sharing them online for others to view. From a new media literacies perspective, it is argued that an ethos of collaboration, participation, and distributed expertise shapes how individuals see themselves in the world and interact with each other as afforded by digital technologies (Lankshear and Knobel, 2006). At the center of this ontological and technocultural shift are youths who engage in alternative and activist practices (Lievrouw, 2011).

Such practices reflect what Cohen and Kahne (2012) call participatory politics, in which interactive, peer-based acts have the ability to reach large audiences, fashion agendas through dialog, and exert greater agency through the circulation of information and the production of original content, both online and offline. In this light, the notion of participatory politics is seen as wielding voice and influence on issues of public concern without being guided by deference to elites or formal institutions. Participatory politics are interest-driven and voluntary. In my continued work with secondary and tertiary students, I have been moved by the potential of participatory politics not only as voluntary, but also as pedagogically operational in critical education (Anyon, 2009a,b; Apple et al., 2009). What happens when participatory politics become a key component of the classroom experience? What pedagogical considerations are necessary to enable both students and educators to embrace varied uses of technology toward alternative and activist practices? In what ways can the curriculum be invigorated by interest-driven and peer-based acts within the confines of school, university, and other formal institutions? Philip and Garcia (2013) remind us of the centrality of pedagogy and the continued need for a dynamic relationship between students and teachers. As such, youth poetry is consistent with growing forms of youth cultural production and participatory politics in the context of new media literacies (Jocson, 2013, 2015). It takes many forms especially given the pace of changing technologies. In classrooms and beyond, it is important to consider how youth leverage new media literacies at the intersection of youth poetry and youth media in order to understand pedagogical possibilities.

On youth media and translocal practices

One of the exciting practices in youth media is remixing cultural material. Remix is the idea that young people are blurring genres of alternative media by building on each other's work and using technology as dialogical tools of power to combat racial injustice, surveillance, and police brutality, among others. The forging of cultural texts as found in multimedia poems and other genres of alternative media has implications for pedagogical innovations in education. Building on these perspectives on remix, the term *translocal* within literacy studies has been theorized in various ways. Scholars have pointed to the limits of the local and asserted the material consequences associated with literacy at a more global level (Brandt and Clinton, 2002). Others have viewed artifacts as central to literacy research and have suggested the importance of attending to the material consequences that artifacts bear in the social world. For example, Braynham and Prinsloo (2009) trace the objects that circulate within and between sites of social human interaction as "things" which are seen as necessary components of social networks and practices (also see Latour, 2005). This is similar to what Lam (2009) and Medina (2010) discuss as translocal literacy practices among youth in a digitally mediated world and the cultural flows that happen through migration and media exchange. Examples such as instant messaging and reading literature in transnational contexts are not only artifactual but also build on cultural imaginaries toward learning and literacy development (see Medina and Wohlgend, 2014). It has also been argued that, in grassroots literacies, texts produced in local economies become translocal documents with different possible uptakes (Blommaert, 2008). More specific to remix in youth cultural production and participatory politics, translocal assemblage (McFarlane, 2009) offers as an analytic frame for place-based social movements with the following orientations:

- (1) Exchange of ideas, knowledge, practices, materials, and resources across sites;
- (2) Building capacity to exceed connections between other groups or places in the movement beyond a node or point in history;
- (3) Relations between and within sites that signify a doing or performance but at the same time are vulnerable to collapse or to reassembling in other forms.

In other words, translocal assemblage provides a way to understand the production and dissemination of youth media work toward the exchange of ideas and knowledge, building capacity and connections, and performance as action. Taking into account existing texts to create new ones (or rewriting the familiar) is central to the process. Multimedia poems, or poems rendered with image, sound, and related effects, display layers of intertextuality that signal a kind of assembling or (re)assembling of cultural material across space and time. For example, the spoken word poem "Barely Audible" performed by then-high-schooler Chinaka Hodge about issues of gentrification in Oakland, California, became the basis for a video produced by NYU Tisch School filmmakers Katherine Copeland Anderson, Eli Jacobs-Fantauzzi, and Vivian Wenli Lin, about similar sociohistorical conditions in Brooklyn, New York (see Jocson with Jacobs-Fantauzzi, 2013). Or the spoken word poem performed by then-college-student Adriel Luis about

gender and standards of beauty became a personal critique of media's depiction of women, particularly women of color, in a video by then-high-schooler and budding multimedia artist Karen Lum (see [Jocson, 2005](#)).

Theoretically, the intertextual nature of media production opens up doors for exchange with similar yet different possible uptakes. Pedagogically, by building on existing media products, it renders the convergence of cultural material as part of translocal assemblage. In my work in higher education, the college classroom has provided a context for instantiations of translocal assemblage in furthering the discourse on racial justice and related topics (see [Jocson with Carpenter, 2019](#)). Students enrolled in my courses have had opportunities to create their own alternative media to render the social, economic, cultural, and political context of their/our time. I discuss related examples in *Youth Media Matters: Participatory Cultures and Literacies in Education* ([Jocson, 2018](#)).

There are many more examples on social media that can build on translocal assemblage practices. They demonstrate a way of speaking back to highlight students' voices about racialized experiences across geographic lines. These works reflect cultural flows as fluid and dynamic. Materially and discursively, these works are indicative of translocal assemblage that point to the exchange of ideas, knowledge, practices, materials, and resources across sites ([McFarlane, 2009, 2012](#)), and the ways in which the connections between them and the potential for reassembling cultural material into different forms of alternative media can be relevant to teaching, learning, and critical education ([Cohen and Kahne, 2012](#); [Soep, 2014](#)). Young people are finding civic resources and telling stories about their political becoming. That requires designing learning environments that support the making of public spheres.

Youth media continues to push our thinking about how youth are coming together in local–distant contexts, participating in the new media landscape, and inserting themselves more actively online and offline to raise awareness about issues that matter in their lives. Some become more visible than others, which may pave the way more quickly for other forms of remix and cultural flows. Indeed, youth are using digital media technology with different tools for different purposes across educational settings using tactics of participatory politics ([Soep, 2014](#)). With an understanding of the relational impact of new technologies on teaching and learning, it is important to see translocal assemblage as the reinterpretation of cultural imaginaries and to ask the following question: How can we as educators and youth advocates create the kinds of spaces, practices, and conditions toward educative possibilities that can have real and tangible social impact?

In thinking about possible answers, educators and youth advocates must also participate in the making and remaking of cultural imaginaries, a kind of public pedagogy ([Giroux, 2004](#)) that extends the who and the how of pedagogy to the ways in which the cultural–political ([Youdell, 2011](#)) can be intertwined in the daily life of school and other educational contexts. This is more crucial than ever as we have seen increasing levels of participatory politics among youth in recent times. The translocal links different forms of struggle and politics of difference in cultural and social movements, where the translocal becomes part of transnational discourses and vice versa. Multimedia poems and other forms of media production offer young people ways of writing the politicized/ing (collective) self. Indeed, many young people are drawing on their voices and talents to challenge normalized discourses, disrupt dominant narratives, and act as concerned members of society. They are performing identities, allegiances, and oppositions that reach wide audiences, to engage in communicative action and to mobilize the public concerning racial justice.

It is no accident that various collectives across locales have come together as part of a historical continuum to remix cultural material with a commitment to social alliance and social action. Alternative media does not just surface because more and more young people are engaging in participatory politics. Tactics of participatory politics such as creating and circulating information via social media platforms often require a continuous process of mediation between people's uses of technology and communicative action to push social and cultural change in certain directions. That is, alternative media in the form of multimedia poems help to incite the exchange of ideas and capacity building to reassemble cultural material into different genres of participatory politics. Translocal practices also enable learning focused on equity and justice-oriented approaches in and beyond the classroom.

Taking a step back, reflecting on the limits of poetry

As much as it is about truth-telling, youth poetry and its many forms are also about remembering. In many classrooms young people are often invited to write from/about their lived experiences that may invoke traumas or the relationships within them ([Jean-Denis and Jocson, 2021](#)). Here, I pause to consider what they may bring to light for deepening our understanding of youth poetry, and what else we as educators and researchers might consider beyond humanist approaches in youth studies ([Albright and Jocson, 2021](#)). The lessons point to key questions.

Trauma, poetry, and literacies

Poetry within trauma-informed literacies has been influential to understanding youth writing. In recent years, trauma-informed practice has become a buzzword throughout many public school districts. The mandates for classroom teachers include remaining vigilant for signs of trauma among youth. But what happens when the trauma stems from the very system that is supposedly designed to keep youth safe? For educators, it is imperative to deepen our understanding of the myriad ways that trauma might be expressed in classrooms and how it manifests through/despite histories of colonialism, enslavement, and dehumanization.

Increasing interests in and applications of trauma-informed practice in education guide us toward scholarship in literacy studies to open up conversations about pedagogy. It is well noted that trauma-informed care has often focused on the individual or on the social emotional learning and resources needed in support of "difficult" students. Rather than extend this approach, there is a call to

shift from trauma-informed care to healing in order to more pointedly address historical conditions and sociopolitical processes that sustain different forms of violence in young people's lives.

While trauma-informed practice is important, [Ginwright \(2018\)](#) in "The Future of Healing" argues that it is incomplete. The focus on individual versus collective experience tends to center on individual pain (trauma), not well-being (healing). Put simply, the focus on "fixing" the person does not get at the root causes of trauma (i.e., context, social and economic conditions). Drawing on his extensive work in urban education and with black youth in the San Francisco Bay Area, [Ginwright \(2016\)](#) in *Hope and Healing in Early Education* encourages educators to consider healing justice practices and suggests ways of supporting youth through complex forms of trauma and combining healing with hope toward social change. Ginwright and colleagues engage in community organizing as part of the healing process. Ginwright proposes healing-centered approaches (radical healing) to facilitate quality of life at the level of both individuals' well-being and the community's well-being—that is, to attend to and restore the economic, political, and social conditions that allow people to thrive. Aligned with healing-informed practices are the limits of socio-emotional learning which, in their view, does not address social forces that shape the health and wellness of communities of color. [Camangian and Cariaga \(2021\)](#) call for a process of humanization, "a reciprocal, mutually anti-oppressive process of self and collective care and development in the context of social transformation" (p. 6). As such, these studies particularly with/for youth and communities of color indicate the limits of trauma-informed care and the potential of humanizing pedagogy in education.

The inextricable link between trauma, poetry, and literacy is important to interrogate. In literacy studies, [Dutro and Bien \(2014\)](#) examine the role of trauma in classrooms. Using the metaphor of the speaking wound, they consider the adult-authored representations of lived experience and how they position students within/through stories of trauma. [Dutro \(2019\)](#) also explicates the importance of critical witnessing and the prevailing ways that trauma may fuel damage narratives about students and their families. It is another reminder that [Tuck \(2009\)](#) admonishes and warns against damage or pain narratives, which are built on notions of brokenness as a "pathologizing approach" (p. 413), reinforcing deficit perspectives particularly among indigenous communities and across communities of color. Relatedly, [Wissman and Wiseman \(2011\)](#) have found in their studies that writing poetry offers an opportunity for students to engage in "narrative control" or "a way of using language to claim the right to name their own experience" (p. 243) as they speak-write in school classrooms about difficult experiences, including family conflict, particularly when conditions at home or constrained relationships limit their conversations. For educators, classrooms ought to consider critical witnessing as a way of paying attention to everyday testimonies while resisting deficit narratives as students receive the support they need.

In more recent works, [Baxter and Sealey-Ruiz \(2020\)](#) demonstrate the importance of poetry as an art form to "mirror Black resistance" against dehumanization and offer a window into collective struggle in line with the black radical tradition. In particular, they illustrate through their own poetry how words heal, or how poetry becomes a medium through which to "bare our soul, release our pain and sadness, and restore ourselves" ([Baxter and Sealey-Ruiz, 2020](#), p. 312). Because as noted time and again "poetry is not a luxury; it is a vital necessity of existence" ([Lorde, 1984](#), p. 37). Because poetry is a site of struggle, a consciousness-raising tool to speak back through "the system of language that excludes her name and all the names of her people" ([Jordan, 1985](#), p. 5), a site of radical openness ([hooks, 1989](#)). To utilize poetry in the classroom, then, is to provide a critical space for healing. We already know this to be significant as various studies on written and spoken word poetry in classrooms or after school programs have promoted a range of pedagogical possibilities with youth's voice at the center (see [Fisher, 2007](#); [Jocson, 2008](#); [Kim, 2013](#); [Morrell, 2008](#); [Sablo Sutton, 2004](#); [Watson, 2013](#); [Weinstein and West, 2012](#)). Healing-centered approaches widen the learning and teaching spectrum for youth engagement in educational contexts.

Keeping in mind a critical space for healing, it is important for educators to step back from trauma-informed practice. When we ask young people to write about trauma, it is very possible that the task may actually be more harmful than we think, not just in the moment but also in other moments to come. Perhaps young people desire something else or would prefer to exercise refusal. While it matters to be heard, seen, validated, and affirmed, it also matters to just be, to exist outside the limits of categories. In an adult-driven world where young people are often constrained by rules and norms, the tendency for many young people is to rely on doing things out of expectations (sometimes against their good sense) in order to be "heard, seen, validated, and affirmed." As [Evans-Winters \(2019\)](#) contends, it is very possible that young people may refuse or may not yet be ready to write about particular moments in their lives, that some young women's "experiences are hers alone to experience and decide if they should be shared" (p. 105). There might be a need for discretion to understand time-space or context differently. There might be a need to rethink current approaches or to steer clear of hurried decisions about what works and what doesn't.

Beyond humanist approaches in youth poetry

In my work, if poems on the page were strictly treated from a humanist, sociocultural lens, then there would be missed opportunities for considering the moments still folding at the time of the writing. What are those moments, and in what ways do they shape (how we view or treat) youth's literacies across various social and educational spaces? In what ways can they better illuminate text and context in youth poetry, or literacy practices among youth? Most salient are sociocultural approaches focused on the construction of words and meanings through dialogic encounters ([Bakhtin, 1935/1981](#)). Specific to youth literacies, for example, poems produced by youth, inclusive of spoken word performances, are influenced by others' voices and writing styles with some utterances drawn directly from existing literary texts. A new materialist approach, attentive to (non)human relationships and moments still unfolding, can help to illustrate how we as researchers are always a part of the phenomenon being studied.

A re-reading of youth poetry is without a re-reading of our own processes of becoming as writers, thinkers, and collaborators within youth studies. For instance, while attuned to dialogism and the ways utterances are lifted from others' words or derived from literature, I recognize the assemblages that influence one's writing and how they materially and discursively shape the text produced. What might a new materialist approach to youth poetry yield to help expand theory and practice in literacy studies? How might a consideration for literacies as assemblage shift how we understand the text produced or the context in which it is produced? How might a consideration of our own processes of becoming influence how we view text and context in youth studies? For example, 17-year-old Carolyn wrote a poem in response to a critical race moment (see [Jocson, 2011](#)). The poem is as follows:

Can you see me?
 When you think black
 You think guns going glack glack
 Sending shots through your neighborhood
 Stores
 There's no turning back
 You wack, you scared
 Can you compare
 To all the lashes I got across
 My back
 Seek
 The curse in my eyes
 The flare of my nose
 The adrenaline in my chest
 The grinch in my teeth
 The bitch in my breath
 Why the hell
 You gotta be so
 Difficult
 Listen to me when I tell you
 What's on my mind
 The truth
 Twisted up but I spit it out
 So let it be known
 What the guns in their hands is all about
 You
 Don't see me
 You see right through me
 You want me locked up as much as the next man
 Do I look like a hoodlum to you?
 I'm not the black you know
 I'm the black you will know
 So I ask
 Once more
 Can you see me?

Similar to Carolyn on a separate occasion, I, too, wrote a poem in response to a critical race moment. Everyday encounters with race and language point to raciolinguistic ideologies ([Flores and Rosa, 2015](#)) that construct what is deemed appropriate linguistic practices in academic settings. The poem titled "academic dialogue" is as follows:

i readandreadandreadandread still refuse to regurgitate the meaning of classic modernist paradigmatic functional discourse associated with those i know don't look like me pressed to articulate whatever sorries may come ambiguous words are just that words
 i writeandwriteandwriteandwrite but still can't find my own way to describe the relationship between polisocioeconomicsubandsuperstructure without calling on marx verbal marks 'cause the words i'm looking for really just tell it like it is spoken so i talkandtalkandtalkandtalk what may come in knots and communicate face to face vocabulary that makes sense settle once and for all freedom among us as words flow from our criticallyconscioustongues.

These two poems serve as examples to echo curricular material from June Jordan's Poetry for the People program (as discussed above), in particular writing to a prompt on racial profiling that many youth poets, students, and student-teacher-poets including

myself encountered in the program. The poems also serve as a heuristic for what possibilities may come when everyday experiences become living entities for analysis and exchange.

In stepping back to rethink the moments that shaped what is revealed and not revealed in the poems, I have asked myself (and perhaps you—the reader—might do the same), “How do these particular instances of writing, of everyday living, of racialized and gendered experience continue to inform the ways I engage youth literacies in my work? What might be missed when my own processes of becoming and enfolding possibilities remain in the sidelines of theory and research?” The “knots” within the poems remain relevant in this very moment, may even resonate in multiple ways, and are worth considering (again). Processes of becoming offer ways of further understanding youth poetry and expanding methodological approaches in literacy studies.

Futures in/of/with youth poetry

There is continued excitement in the field of literacy studies. From the purview of youth poetry, I am inspired and compelled by contemporary scholarship on youth civic literacies and civic reasoning (Mirra and Garcia, 2020; Lee et al., 2021), speculative education and fiction writing (Nasir et al., 2021; Toliver, 2021; Thomas, 2019), and multimodality in youth engaged research (Lam et al., 2021; Ybarra, 2021). These areas not only push the way of thinking about or the potential of youth poetry across learning environments, including the digital, but also offer methodological openings for how we do inquiry with considerations for what young people have to say, their use of alternative modes of storytelling, and how they share their perspectives situated within social, cultural, political, historical, and geographic/spatial contexts, as well as the conditions in which they live, thrive, and struggle. Pursuing forms of poetic inquiry will require serious considerations for method-making and innovative approaches espousing arts-based critical methodologies to reimagine education (McKittrick, 2021; Rashid and Jocson, 2021). This means engaging less prescriptive and more creative (often speculative) endeavors in pursuit of otherwise worlds (Crawley, 2016).

From my experience monitoring youth’s engagement with poetry in the US, I am inspired and compelled to lean in (a bit) closer to hear what young people have to say, inciting ideas about how education might respond to serve all students. Youth poet laureate Amanda Gorman at the 2020 US Presidential Inauguration delivered an incisive message reaching the hearts of many around the globe. Her words from “The Hill We Climb” now extend far beyond that particular moment in time. Her written poems fill many other pages of books, headline social media sites, and are featured on various websites of poetry organizations (Gorman, 2021a,b). Her poetry has also been published as a children’s book, *Change Sings*, in collaboration with bestselling illustrator Loren Long to enliven each storied line. Civic literacies along with the multimodal dynamics of poetry and the speculative nature of storytelling are embedded. Such are examples of youth poets remaking the world and shaping future directions in literacy studies.

Acknowledgments

This entry is made possible by long-standing relationships and co-learning over the years with youth poets, artists, teachers, and partners in education. I am grateful to co-authors and collaborators for opportunities to engage youth poetry through interdisciplinary perspectives, some of which are included here. Readers are encouraged to learn more from the cited works.

Youth Out-of-school (critical) literacies, texts, and audiences

Across the globe and at every moment of each day, one can find youth reading, composing, listening to, and viewing many different forms of print, multimodal, and video texts. They consume, compose, and critique texts when ideas matter to them, demonstrating multiple, often quite varying literacies around family, face-to-face and digital friends, schoolmates, fan groups, and workplace colleagues. This means that the literacy practices they exercise cannot be painted with the same brush: their literacies, texts, and audiences differ by their ages, gender identifications, races, classes, interests, experiences, geographies, resources, and cultures. Their literacies, texts, and audiences reflect the privileges, oppressions, aspirations, disappointments, inclusions, and exclusions demonstrated and experienced by their respective social groups.

For half a century, scholars have documented the social nature of youth's out-of-school literacy practices, distinguishing them from the academically-driven practices of school by purpose and not necessarily physical locale, since youth deploy such literacies when they are in school, too (Hull and Schultz, 2002). The not-so-subtle parenthetical play on words in this essay's title, Youth Out-of-School (Critical) Literacies, Texts, and Audiences, refers, first, to the idea that youth's out-of-school literacies, texts, and audiences are central, aka critical, to how they draw on literacy practices to situate themselves in non-academic physical and social spaces. The word, critical, also references the literacies youth use to judge explanations offered in texts they consume. The parentheses signal the tentative, fluid character of youth identities and their literacy practices, which shift shape with evolving pop culture, technology, and affinity groups. In the following sections, I summarize what is known about youth literacies, texts, and audiences. This is followed by a foray into implications for research, instructional practice, and policy, and a conclusion.

Youth's literacies

Curwood (2013) captured one category of youth literacies in an analysis of the fan fiction composed by one youth to connect distinctive features of the *Harry Potter* series with those of *The Hunger Games* series, popular fantasy novels and film series of the time. Her study participant, 16-year-old Cassie, drew on various elements of the ten texts of both literature series to design videos and interactive texts, share news in print and podcasts, and manage user accounts for a site dedicated to *Harry Potter*. Because of her well-known fan fiction prowess, Cassie was invited by another fan fiction website manager to write about an assigned character from *Harry Potter*, Colin Creevey, designing the story format, storyline, and outcome. Curwood shared Cassie's response to this invitation:

Cassie felt it was an incredible honor to be asked to contribute Colin's story. As a fan herself, she knew that her readers would be smart, be concerned about authenticity, and have high expectations of any *Harry Potter* and *Hunger Games* remix. As a writer, Cassie was motivated by the opportunity to learn from mentor texts penned by J.K. Rowling and Suzanne Collins. She specifically talked about her goals as a writer, and she readily drew on resources that existed within the fandoms and affinity spaces. Moreover, Cassie was eager to share her work with a global audience. Through the process of remixing, Cassie deepened her knowledge of the *Harry Potter* and *Hunger Games* canons at the same time that she honed her craft as a writer (pp. 88–89).

Curwood's description of Cassie's response acknowledges the youth's written fiction composing literacies, including purposeful uses of mentoring texts, narrative structure, and sense of audience, skills Cassie acquired by writing for and consuming the fan fictions of similar websites.

Millions of youth across the globe demonstrate such literacies in fan fiction compositions, along with acumen in an array of other social media contexts. Despite this, US youth are among those who are described by some as possessing deficient literacy skills

en masse (Salinger, 2011). This stance reflects one common understanding of the word, literacy, which refers to individuals' ability to read and write as reflected by standardized assessment performance. Brian Street (1984) labeled this view universalist or autonomous because of its contention that the most successful readers draw on early language experiences and school reading and writing instruction to learn uniform skills in predictable stages (Chall, 1983). According to this view, literacy instruction should focus on teaching and measuring these skills. When students do not follow the expected pattern of skill acquisition, they are deemed deficient. Based on tasks that involve reading and answering questions about small samplings of texts, the results of these assessments serve as reductive proxies for the more purposeful, wide-ranging literacies of youth like Cassie.

The word, youth, is typically used to refer to young people who are past puberty but not yet adults (Lesko, 2012). Like its frequent synonym, adolescent, the construct arrived with the industrial revolution and the dawn of the field of psychology at the turn of the last century (Hall, 1905). Common usage of both terms confers a transitional, "not yet" status that often results in advice to "wait until you are an adult to understand the real world." This generalization does not acknowledge the stance I take in this chapter, which embraces as important what youth learn from childhood interactions and the communities within which they find themselves. This perspective also embraces the ways youth literacy practices shape and are shaped by the evolving, intersecting identities youth adopt, enact, and shift frequently, most with so-called real-world repercussions that depend on how and with whom they see themselves at any given moment (Alvermann and Moje, 2019; Gee, 2015b; Smith et al., 2022).

Scholars who embrace the out-of-school literacies referenced in this chapter's title hold more complex, socially situated views about the nature of literacy. These views acknowledge that uses of communicative symbolic practices, including those involved in reading, writing, and viewing, are shaped by the purposes for which they are developed and deployed—a social practices viewpoint which has been gaining acceptance since the argument was first made in the 1980s (Scribner and Cole, 1981; Street, 1984; Wertsch, 1991). For instance, the United Nations Educational, Scientific and Cultural Organization (UNESCO) has adopted the multidimensional, purpose-driven realization that, "The concept of literacy has evolved from basic reading, writing and numeracy skills to broader notions such as functional literacy and a foundation for lifelong learning" (UNESCO, 2019). This view is also aligned with the US National Academies of Sciences, Engineering, and Medicine (2018) conceptualization of all learning as socially and culturally situated, a situatedness that means literacy practices differ across social and cultural groups (Barton and Hamilton, 2000; Cazden et al., 1996).

There are multiple and evolving theoretical explanations of the social nature of literacy (Burnett et al., 2014). The underlying premises of social theories of literacy hold that very young children drive their own literacy acquisition due to their immersion and help communicating in the socially- and culturally-driven verbal and symbol systems that surround them in families and communities (Lee et al., 2020; Sulzby and Teale, 1991). They learn the code breaking, meaning making, text use, and text analysis skills and strategies of print literacies with school instruction even as they simultaneously develop out-of-school literacy practices that vary across social and geographic contexts (Freebody and Luke, 1990). They refine their literacy skills and strategies with their use of online and offline school texts as well as in the texts found in their homes and favored community settings (Nelson et al., 2020; Vetter et al., 2021), skills and strategies that, like Cassie's, are not well represented by standardized assessments (Brandt, 2015; Mislevy, 2016; Willis, 2012).

Social perspectives toward youth literacies acknowledge how such literacies are embedded with the shifting, evolving identities they enact at home, in school, and with peers (Blaikie, 2021; Paris, 2011; Vetter et al., 2021). From their earliest years, they develop literacies from interactions with family and other caregivers using such shared texts as directions, cereal boxes, religious texts, children's books, and community signs (Heath, 1983). These literacies continue to develop as youth's social worlds expand, sometimes from reading and writing in school, but also from other affinity groups, including church groups (McMillon, 2017; Sarroub, 2011), writing groups (Blackburn, 2003; Watson and Beymer, 2019), and gangs (Moje, 2000). Youth become aware of multiple intersecting linguistic and social systems. They learn to navigate these systems within and across assemblages of social, cultural, linguistic, political, and geographic, often conflicting boundaries, including transnational and translingual boundaries (Baker-Bell, 2020; Guerrero-Arias, 2021; Iwase, 2014; Kinloch et al., 2020; Price-Dennis and Muhammad, 2021; Skerrett and Omogun, 2020; Tomei and Hollington, 2020). They develop dialects, languages, and literacies for the use and production of the texts they use most frequently because it is in their interest to do so (Creese and Blackledge, 2010; Nkadameng and Makalela, 2015; Stroud and Wee, 2012).

Youth also develop literacies in familiar settings that can allow them to note whose perspectives are represented, or not, when texts are brought into communities, as well as the implications of such insights (Braden, 2020). These critical literacies assume multiple forms, depending on where and with whom youth spend their time (Smith, 2020): Cassie, at the beginning of this section, demonstrated her understanding of perspective as she remixed elements from various literary mentor texts. Vasquez and her colleagues described such critical literacies as "looking at an issue or topic in different ways, analyzing it, and suggesting possibilities for change and improvement" (Vasquez et al., 2019, p. 300). Freire (1985) offered the following explanation:

The act of reading cannot be explained as merely reading words since every act of reading words implies a previous reading of the world and a subsequent rereading of the world. There is a permanent movement back and forth between "reading" reality and reading words—the spoken word too is our reading of the world. We can go further, however, and say that reading the word is not only preceded by reading the world, but also by a certain form of writing it or rewriting it. In other words, of transforming it by means of conscious practical action. For me, this dynamic movement is central to literacy (p. 18).

Youth's texts

Like youth literacies before the dawn of the social media age (Finders, 1997; Moje, 2000), youth's present-day text production and consumption are social, wide-ranging, and rapidly evolving, facilitated by the global connections made possible by the Internet. As an example of one youth's novel mix of media and ideas, Wargo (2018) described how one youth, Andi, used a GoPro video camera and iPhone voice memos to compose a multimodal text. Wargo summarized:

As a form of resistance, Andi composed a text that used sound to amplify the silences that formal education presented to her as a lesbian-identifying Latina. Through walking the city and writing it with sound, she presented a topography and depth of experience that disoriented the listener and onlooker. From upside-down visuals to the ambient acoustics of homophobia and misogyny, Andi delivered a multimodal walk that is both textually interpretive and affectively felt... a practice that worked to reorient the space, place, and perception of schooling; who she was as a survivor; and how she navigated personal issues of injustice (pp. 21–22).

Wargo illustrated how Andi's multiple and evolving literacies were used to compose a compelling, identity-threaded new form of text, composed because the ideas mattered.

The Chinese are generally credited with inventing paper and the earliest forms of printing, however, human invention of written language occurred multiple times even before the invention of paper, with cave paintings, strings, and shells (Ferrara, 2022). Gutenberg's refinement of an efficient printing press in the mid-Fifteenth Century initiated a proliferation of printed texts that continues today (Kurlansky, 2016). The term, text, is commonly used today to describe books, most often school textbooks. However, scholars exploring the social nature of literacy in the late Twentieth Century began to apply a broader definition, using the term to refer to multiple forms of symbolic representations that readers decode, interpret, and compose and including print, video, photographs, paintings, and music, and including digital and mixed, multimodal forms (Fish, 1980; McLuhan, 1966).

Contemporary youth texts evolve with society and include print on paper or published in digital form, film, or ever-changing social media platforms, such as Facebook, Instagram, SnapChat, and YouTube, that are accessible from computers, smart phones, tablets, gaming systems, and libraries (Boyd, 2014; Boyd and Brock, 2014; Coiro et al., 2008; Lankshear and Knobel, 2011). When viewed as social and cultural representations, such wide-ranging forms as memoirs, comics, anime, and multimodal composition illustrate how youth's consumption preferences and composing practices are threaded with identity (Rogers and Marshall, 2012; Rowsell and Pahl, 2007). Alvermann and Sanders (2019) described these literacies as "new in the sense that social, economic, cultural, intellectual, and institutional changes are continually at work" (p. 1), noting that youth who grew up in the digital age often enact multiple identities in varied forums, easily shifting literacy identities as they move among affinity groups.

To counter periodic claims of today's youth's a- and illiteracy, literacy scholars who are interested in social practices perspectives have devoted much attention to capturing youth's purposeful and prolific use and production of texts outside of school. Studies have described youth 'zines (Finders, 1997; Rogers and Winters, 2010), gang tags (Moje, 2000; MacGillivray and Curwen, 2007), self-advocating essays and poetry (Blackburn, 2003; Gudjonsson, 2018), and religious texts (Sarroub, 2011; Weyand and Juzwik, 2020). Social media have become an especially important site for youth's collaborative and inventive text use (Burnett and Merchant, 2020), including instant messaging (Lam, 2009; Lewis and Fabos, 2005), multiplayer online gaming (Abrams and Lammers, 2017; Grzesiak, 2018), anime (Chandler-Olcott and Mahar, 2003; Fukunaga, 2006), songs (DeRoo and Watson, 2020), hip-hop poetry (Castillo, 2021; Alim, 2011), fanfiction (García, 2013; Lammers, 2016), drama (Kim and Omerbašić, 2017), and TikTok videos (Jerasa and Boffone, 2021; Nam, 2020). The literacies invoked by these varied texts are typically developed and shared among group members, often across geographical and political boundaries (e.g., Ellison, 2014).

Texts take on complex social meanings tied to where, when, and who produces and consumes them (Collins and Blot, 2003). Their forms are shaped by the uses individuals find for them and the affinity group literacies used to compose, distribute, and read them. Composers produce them from their world experiences, and readers interpret them through lenses they develop from their own experiences. Social disparity can result in inequitable participation in society when only some individuals have more access than others and, as a result, are invited, or not, to learn the literacies needed to access a group's texts. This means that, despite the ubiquity of youth's literacies, each youth's access to the literacies tied to their aspirations is uneven at best and selectively oppressive at worst (Alvermann, 2016; Bloome and Green, 2015; Gee, 2015b).

As noted earlier in this piece, the term, critical, can be used to describe texts youth consume and produce as well as the ways they can and, many would say, should consume texts they encounter each day. This is especially true of popular media texts generated by commercial entities, such as Meta, Twitter, and TikTok, that do always not have youth's best interests at heart (Luke, 2019). When youth consume and produce texts to address purposes, topics, and tasks they find compelling, meaningful, and familiar, they are more likely to be able and willing to weigh issues of accuracy, perspective, and representativeness. They are also more likely to search out texts to enlighten themselves about the chasms and possibilities of competing perspectives, whether the texts are videos, novels, or fanfiction websites (Guzzetti and Lesley, 2016).

Youth's audiences

When [Muhammad and McArthur \(2015\)](#) conducted a study to explore girls' perceptions of cultural media representations of Black people, one young woman's response recognized that such representations did not seem to understand her and others in their study group, saying:

Who can tell our stories best but us? We determine how we think of ourselves, not by what other people think of us. But our actions affect others' perceptions. If you think that we are not portrayed in media badly, you obviously don't spend enough time watching television, reading magazines, or listening to music. Other people who are not black think we are always out to commit violent actions. That's just media. We can take control by starting our own representations of who we are as young black girls leaving an impact on other young girls' lives (pp. 137–138).

Muhammad and McArthur explained that the young woman, Dahlia, “wrote back against such views in the last lines expressing that she and other Black girls can reclaim authority to set their own standards of representation” (p. 138). All the young women in this study wrote for similar purposes, to address an audience of people like them and the world at large to counter negative media stereotypes that did not consider them accurately as an audience.

Audience, the final central construct of this *Encyclopedia* chapter, is a term that is commonly used to describe those who read, view, or listen to others' compositions. As such, connecting with audience is a consideration for composers across media. Social perspectives toward literacy added nuance to scholarly understandings of how audience works. [Fish \(1980\)](#) long ago introduced the idea of instantiated understandings—written communication—that occurs when individuals can draw on shared cultural knowledge of symbol systems. Audiences are composers' interpretive communities across modalities. Youth serve as audiences for others' texts and, in turn, compose texts for print, multimodal, or digital audiences that emulate those texts that they most consume.

Youth become audiences to a seemingly infinite range of texts as producers and consumers. Their audiences and authors of texts they consume may include individuals known, unknown, near, and far. Youth are primary users of a range of communication technologies and social media, showing more savvy in their selected venues than many adults and offering a blueprint of possibilities in new forms of text. They are often the first to recognize the potential of new digital fora, becoming early adopters of Facebook, and then Twitter, Instagram, Snapchat, YouTube Gamer platforms, and TikTok as outlets for their compositions and consumption ([Alvermann, 2004](#)).

Youth's literacies are, thus, tied to their service as audience for others' literacy enactments. Their literacy practices are honed among individuals who serve as one another's audiences in person, print, or digital media. Youth, thus, serve as audiences for others' videos, memes, and blog posts or for similar texts by unidentified others who participate in their social networks. They draw on varied text forms and social media platforms according to their understandings of the conventions of their varied social groups. Practices evolve according to family, school, and community cultural practices, traditions of worship, or shared genuine or manipulative interest in music or reading genres, video and tabletop games, jobs, or hobbies, with groups shaping their practices to suit communication purposes. Variations among groups evolve from differences in groups' purposes for communicating. As a result, youth's literacies outside school are in a near constant state of fluctuation, along with their identities, as they enter and exit social groups. As they expand their networks they are increasingly likely to be duped, at least until they learn more nuanced aspects of communication within these networks ([Garcia, 2020](#); [Gee, 2015a](#); [Kress, 2003](#)).

Youth consume and produce texts to experiment with enacting varied identities, even producing texts for which they are their own audiences as they try on different personas ([Lewis et al., 2007](#)). Many youth write to each other and the world at large to demonstrate their identities in response to stereotypes of others, including popular media, as in [Muhammad and McArthur's \(2015\)](#) study at the beginning of this section. Researchers have also recorded how youth performed texts they created to disrupt observed LGBTQ-related inequities ([Schey, 2020](#)) and drew on religious and secular texts to mediate life as Yemeni American females ([Sarroub, 2002](#)) and Christian fundamentalists ([Eakle, 2007](#); [Skerrett, 2014](#)). This research was followed by additional work exploring how social affiliations, including race, gender, social class, dis/ability, and culture, and the intersections of such affiliations (e.g., Black girls, cognitive disabilities of those in poverty), have shaped youth's texts and audiences historically and in present times ([Collins and Ferri, 2016](#); [Kendi and Blain, 2021](#); [Kinloch, 2015](#); [Muhammad and Haddix, 2016](#); [Tatum, 2008](#); [Ybarra, 2020](#)).

Youth continue to refine literacy practices over time to address audiences of both real and imagined affinity groups. They draw on myriad media and popular culture discourses that are shaped, in turn, by innumerable commercial and political interests ([Alvermann, 2004](#); [Alvermann et al., 2003](#)), literacies that may be coopted by such global transmedia enterprises as those involving Harry Potter, Star Wars, Minecraft, and Fortnite ([Fung et al., 2019](#); [Kraidy, 2017](#); [Lemke, 2009](#); [Ünver, 2018](#)), which, in turn, inform local cultural, political, and heritage projects ([Burkholder, 2017](#); [Freeman and Proctor, 2018](#)). Some youth figure out how to restructure cooptation by composing elaborate counter-narratives, as in fanfiction characters drawn from popular literature ([Duggan, 2021](#); [Lammers, 2016](#); [Sugihartati, 2020](#)), videogame paratexts posted on YouTube and featuring gamer footage with player commentary ([Burwell and Miller, 2016](#)), and as exemplified by the young woman's composition at the beginning of this section. These exercises of critical literacies were described by [Rogers and colleagues \(2014\)](#) as “expressions of resistance to the inheritance of the broken promises of democratic citizenship and their ability to imagine new possibilities for public engagement” (p. 2).

Implications

Along with other aspects of language and communication, youth develop literacies they need for successful communication within their varied, often intersecting, affinity groups. The texts youth generate and consume are myriad and ever-changing. They develop critical literacies as they situate themselves in communities, develop insight about how others' texts are situating them, and gain the sense of audience needed to navigate these experiences successfully. These literacies are critical, too, because they allow youth to navigate within and across social groups. When youth initiate communication and their intended audience does not respond as they predicted, it is likely because there is something about the speech community, modality, or symbol systems they do not understand.

One of current society's greatest youth stereotypes is that they are "all" on the most popular social media software platform *du jour*, chasing each other from Facebook to Snapchat to Instagram to YouTube to TikTok as adults in their life share their applications. Predictably, reality is more complex, and some youth have more success than others with the shifting involved in navigating multiple communities of practice (Knobel and Lankshear, 2007; Vasudevan et al., 2014). Others elect to be less visible in some contexts than others, and still others are forced out of groups when hegemonic group practices promote bullying and other forms of exclusion (Nilan et al., 2015).

Researchers who study out-of-school literacies have engaged in valiant efforts to understand intersections of literacies, texts, audiences, and identity that are invoked by affinity groups. Digital exclusion scholars have begun to describe the relative nature of intersections of personal circumstances, social group processes, and exclusionary social structures. Gaining the insider access needed for nuanced insights about why some aspiring group members are marginalized or excluded has been more problematic, sometimes resulting in ill-conceived efforts to include individuals who are marginalized because of gender identification, race, social class, or disability that worsen the marginalization (Setchell et al., 2021). More work in this area is needed if youth are to develop abilities needed to access to all their aspirational groups (Helsper, 2017).

There have been multiple calls for importing youth's out-of-school literacies to school to heighten youth's school engagement. Alvermann, for instance, argued against separating out-of-school and in-school literacies because she saw educators organizing multiliteracies projects (e.g., book clubs, web searches) that invoked youth's motivation and self-efficacy with the same level of engagement as has often been observed in youth's out-of-school literacy practices (Alvermann and Moore, 2011). Alvermann and colleagues (2012) have also made the same argument in reverse, demonstrating how youth's engagement with so-called out-of-school literacy practices rival the most impactful in-school literacy practices, erasing the divide between the two settings.

Even though popular media frequently suggests this, it is probably as bad an idea for educators to appropriate youth's out-of-school literacies for use in school as it has been for adults to appropriate youth's social media networks, chasing youth to ever newer, more exclusive platforms. However, educators would also be foolish to underestimate or fail to appreciate the literacy skills and strategies youth develop within their outside-of-school affinity groups. Pedagogies that offer youth the chance to utilize their community-based literacies to shape their own learning—as well as the learning of the educators who serve them—can also help us to reshape schools and literacies in new, more relevant, inclusive ways (Yosso, 2005). Scholars have begun to offer multiple examples of educators are doing just that, individuals who design classroom inquiry to incorporate youth's resources to reshape school tasks and literacies, inviting these youth to be the next generation of scientists, historians, game engineers, literary theorists, and plumbers, reshaping literacies and the youth's aspirations (e.g., Alford, 2021; Chandler-Olcott et al., 2016; Hull and Stornaiuolo, 2010; Learned, 2018; Mills et al., 2018; Mirra and Garcia, 2021; Moje, 2015; Muhammad, 2015; Pandya et al., 2022; Unsworth et al., 2022; Vasudevan, 2020). Educators need multiple models of instruction that incorporates such insights for various youth age groups across disciplines. Policymakers need to embrace such models in lieu of the reductive, assessment-driven approaches to school that are now in vogue.

There is danger in inviting youth to engage in such inquiry without also figuring out how to trigger their deployment of critical literacies. Such literacy practices can help them to understand, accept, or reject various sides of any new argument in any context with empathy and insight. Luke (2019) is among those who have recommended that educators invite youth to critique all texts, including those that represent shared points of view and those in opposition, by drawing on such questions as, "How does language, text, discourse and information make a difference? For whom? In what material, social, and consequential ways? In whose interests? According to what patterns, rules, and in what institutional and cultural sites?" (p. 351). Such critical literacies will allow youth to shape and navigate their own and other's participation in all aspects of all the world, including school, in more relevant and equitable ways.

Introduction

What is meant by “gender” in the extant research on literacy? How has gender been examined in literacy research? To answer these questions requires an examination of the construct of gender and an integrative overview of literacy research. In doing so, we highlight the ways in which gender has been treated in research that examines literacy as a cognitive achievement or performance (e.g., Reilly, 2012), as well as a social or sociocultural practice (e.g., Gee, 1992; Street, 1996). We present studies that describe the literacy practices of males and females, particularly those studies in which other social factors or subjectivities that intersect with gender were considered, those in which gender was considered beyond gender binaries, and those that were analyzed from a gender framework.

To begin, we present an overview of research on gender and sexuality, problematizing the social models and consider how the discourses of education can reproduce stereotypical, heteronormative binary gendered identities. We present findings from international reports and views of scholars from various nations, defining how gender has been viewed in the extant research and deconstructing those views. In the next section, we examine how educational discourse and practices influence the engagement of males and females in literacy and critique the gender differences in literacy assessments and their interpretation. We then view literacy from a cognitive perspective as a product or process of cognition by discussing gender as an influence on literacy achievement and by presenting results of national and international survey research reports of literacy achievement and engagement analyzed and compared by gender, as well as criticisms of those results and their interpretations in regard to gender implications. In the final section of the report, we examine literacy as a social practice utilizing research conducted from the perspective of literacy as a social or sociocultural practice (Gee, 1992; Street, 1996). We consider gender and literacy practices of those who identify as female, male and beyond the binary. We conclude by identifying gaps in the literature on gender and literacy and suggest directions for future inquiries.

Perspectives on gender and sex

Conceptualizations of gender and sex within societies are generally associated with the biological or physical state of an individual. With rare exceptions, an individual is identified at birth as either biologically male or female despite the range of bodily morphologies and chromosomal configurations (Paechter, 2007). Physical characteristics classify an individual as either male or female. From this perspective, gender is synonymous with biological sex which typically alludes to gender binaries as an individual being male or female, which in turn leads to both gender and sex being misconstrued as fixed. Sexuality, as with gender, can be fluid but can include “many different elements besides gender (fantasies, emotions, power, biology, ability, props, preferred partners, acts, milieus and so on)” (Persson et al., 2020, p. 57 citing Sedgwick, 1993).

Gender stereotypes from a binary view of gender attribute certain characteristics as “natural” or “innate” to men and to women. For instance, men are thought to be aggressive, forceful, independent, rational, strong, active and decisive. In contrast, women are considered to be kind, helpful, beautiful, emotional, weak, passive and concerned about others (Francis, 2010; Francis and Paechter, 2015; Kollmayer et al., 2018; Meier and Diefenbach, 2020). These stereotypical beliefs aligning gender and sex to one’s personal capabilities, thoughts, behaviors, roles and interests can affect an individual’s education, cognition, career or life choices (Kollmayer et al., 2018).

From a social learning theory perspective, gender is a “relatively stable binary construction reproduced via societal institutions” (Francis, 2010, p. 477). Individuals learn how to “be” a boy or girl and a man or woman by interacting with their communities of practice (Paechter, 2007; Wenger, 1999), including their family members, teachers and peers, and fellow employees or employers at work. They learn to perform in heteronormative gender-appropriate ways through these dominating discourses. Francis (2010) noted that gender is “a construction that is socially dominant; and which authors itself as a unitary, total, inevitable, and natural, system ... and is commonly understood and agreed as a ‘true’, uncontested account” (p. 479). Through the doing of binary gender, differences between girls and boys and women and men are created which are not natural, essential or biological, but are entrenched in social norms, practices and rules (Callahan and Nicholas, 2019; Subrahmanian, 2005). Gender is thus misconstrued as fixed and synonymous with binary conceptualizations. It should also be noted that sex, like gender, is not exclusively male/female but can also be fluid.

With the act of categorization comes the problem of reproducing gender binaries. Labels are associated with different performances of gender with the heteronormative as the basis for categorization which can override individual identities (Callahan and Nicholas, 2019). The labels individuals employ may constrain an individual’s identity construction but can also de-emphasize difference in different generations (Persson et al., 2020). The proliferation of labels has occurred alongside “newer discourses [which] have emerged that emphasize ‘sameness’, seeking to represent gays, lesbians, bisexuals, *trans** and other queer people as good citizens deserving of equality and access to the same rights and social institutions as heterosexuals—still different, but not that different” (Persson et al., 2020, p. 57). Persson et al. (2020) note that those born in the 1990s seem to negotiate a “spectrum of possibilities” which were “less about difference from a norm (in a Derridean sense) than about a deeper sense of specificity” (p. 66) and that could also “be read as being less about departures from hegemonic heterosexuality, than about the production of abundant identities that set themselves apart from older mononormative templates” (p. 67).

Families and teachers may reinforce traditional and stereotypical views of gender, resulting in girls and boys either conforming or nonconforming and being confrontational. Educational environments from pre-school to the university are places where “binary discourses produce gendered bodies” (Callahan and Nicholas, 2019, p. 707). From a young age these binaries are reinforced through media, advertising and in interactions between adults and children: the language they use, the behaviors and actions they encourage and discourage, the clothes they choose for children to wear and censure for wearing, the toys they purchase, to the color of the clothing and their rooms (Paechter, 2007). This surveillance and disciplining of children’s gendered bodies continues to be reinforced with the practices of school as “children’s bodies are regulated and controlled, often in ways that are gendered, so that they may have to wear particular forms of clothing, sit in specific ways, at particular times and in designated places and, at times, to act more as a collective than as an individual body” (Paechter, 2007, p. 61). However, it is not just the adults that police gender “appropriate” behavior, peers also pressure others to conform. As Paechter (2007, p. 64) comments:

Children come to nursery or school with their existing understandings of masculinity and femininity, developed in the communities of practice of which they have previously been members. They are also influenced by the values and perceptions of the adults in the setting, staff and peer conceptions of what is ‘natural’ behaviour, images from the media, and as they grow older, the structures of school. They use these, in conjunction with the perceptions of other newcomers and the constructions dominant within the peer group, to construct group understandings of the rules of being a ‘proper’ boy or girl in this context.

Troubling social models of gender and sex

In the 1980s and 1990s, feminist and post-structural theorists challenged binary constructions of gender and the categorization of certain behaviors as “masculine” or “feminine” as precipitated around social inequalities (Francis and Paechter, 2015). Gender came to be viewed as socially constructed by acknowledging that gender “operates across individual, interactional and institutional levels of social life” (Callahan and Nicholas, 2019, p. 706). Gender is “not a property of bodies or something originally existent in human beings ... it is a product and process of various social technologies, institutional discourses, epistemologies, and critical practices, as well as practices of daily life” (de Laurentis, 1987, p. 3 cited in Sanford, 2005, p. 304). Butler (1990), as cited in Callahan and Nicholas (2019) noted that “gender functions as a discourse that produces what it names” (p. 706).

This challenge to the accepted “naturalistic” view of gender facilitated a fuller understanding of and attention to gender complexity and fluidity, but still focused on the performance of gender by gender-appropriate bodies (Francis, 2010; Francis and Paechter, 2015). Connell (1995) drew attention to a variety of behaviors associated with performed masculinity with hegemonic masculinity or the legitimization of men’s dominant position in society and subordination of women. Researchers (Francis, 2010; Francis and Paechter, 2015; Paechter, 2006, 2007) began to use the plural—“masculinities” and “femininities”—to acknowledge that there is not a single form of masculinity or femininity, but rather competing, contradictory, and overlapping forms (Kehler, 2010). Paechter (2007) used the terms “masculinities” and “femininities” to mean the varying ways in which individuals “do”

boy or girl or man or woman and how individuals through their behaviors and attitudes, actions, thoughts, and dispositions demonstrate to themselves and to others how they are male or female.

However, these labels of masculine or feminine are problematic as they imply a binary exists and that there are actions, abilities, and behaviors that can be characterized as masculine or as feminine. This practice can continue to essentialize or stereotype individuals and social constructions of gender. Any binary sets up one category as superior with the other as subordinate; as a result, they are not equal (Callahan and Nicholas, 2019). Francis and Paechter (2015) commented, “female” non-gender-traditional expression is not read as “doing masculinity” or male non-traditional constructions as “doing femininity”; rather, researchers tend to identify and analyze gender-traditional behavior (p. 778).

Gender attribution acknowledges that the performance of gender is enacted through shared knowledge of social norms and signs, such as clothing, language and other social cues (Callahan and Nicholas, 2019; Francis and Paechter, 2015). These performances allow individuals to claim attributions of gender which “will be enacted in a differential way between, for example, transmen and transwomen, with the former more likely to have their gender claims legitimated and accepted than the latter” (Francis and Paechter, 2015, p. 781). Children’s experimentations with gender have become more acceptable although this experimentation is more socially acceptable with girls, such as enacting ‘tomboy’ identities, than it is acceptable for boys (Francis and Paechter, 2015). Adolescents also experiment with gender labels beyond the binary as they attempt to find one that captures their gender or sexual subjectivity (Persson et al., 2020). Experimenting with gender could be viewed as “some boys do girl as their way of being a boy (inhabiting or living that male body) and vice versa” which may be considered transgressive because the performance does not match the expectations of the body (Paechter, 2012, p. 239).

Sex role theories view masculinity and femininity as being located solely within male and female bodies whereas gender relational theorists see gender as more “fluid” (Connell, 1995; Skeggs, 1997; Skelton and Francis, 2003). Rather than seeing boys and girls in stereotypical ways (girls do “x”, boys do “y”) which is characteristic of sex role theories, gender relational theorists argue that gender is essentially constructed in relation to and in opposition to the other (that is, masculinity is what femininity is not) and is influenced by context (Connell, 1995; Skelton and Francis, 2003). Skelton and Francis (2003) argue that more recent thinking demands a consideration of the multidimensionality of identity whereby masculinities and femininities are viewed as shaped by social class, sexuality, religion, age, ethnicity and other social factors. Simply focusing on gender denies the influence of other subjectivities or social factors on behaviors, representations and identity formation, including a person’s socio-economic background, culture, race, ethnicity, sexuality, religion, family, and schooling (Martino and Kehler, 2007).

Gender, schooling and literacy

Gender as a social construct may affect what is and can be learned in and out of school and what is considered to be out-of-bounds (Sanford, 2005; Subrahmanian, 2005). The expectations of school personnel often reinforce stereotypical views about the interests and behaviors of boys and girls and how they learn which may limit students’ engagement and career choices in a discipline or subject (Retelsdorf et al., 2015; Sanford, 2005). These expectations may also influence students’ self-concepts by presuming differences in abilities and behaviors according to gender which in turn may impact students’ academic performance. Teachers can make a difference in students’ achievement (Hattie, 2003), but teachers’ judgements of students’ academic performance can also be influenced by their students’ (mis)behavior, particularly when teachers award higher grades to girls than to boys for the same performance (Buchman et al., 2007; Meier and Diefenbach, 2020). An individual’s self-confidence is based on experience; therefore, lower achievement in reading and writing may result in less motivation for engaging in literacy practices (Kollmayer et al., 2018; Meier and Diefenbach, 2020). As Retelsdorf et al. (2015) noted, “teachers acting upon gender stereotypes could—consciously or unconsciously—shape social interactions in class by, for example, creating a warm and challenging atmosphere for students from positively stereotyped groups and a cold and less challenging environment for challenging students from negatively stereotyped groups” (p. 188).

Being a good student or “ideal student” has been aligned by teachers and schools to fit stereotypical feminine characteristics, including listening and attending to the teacher and to others, working hard, being diligent, being conscientious, working collaboratively, and being articulate (Martino and Kehler, 2007). Enacting the ideal feminine student may not bring benefits for young women in post-school life, however, as being a submissive girl in school settings may disadvantage females in the workplace where assertion, leadership, and initiative are valued (Beaman et al., 2006). Being a compliant student can also be problematic for boys as being compliant is a subordinate position which is typically understood as a feminine posture (Paechter, 2012). These views construct a hegemonic gender binary, essentializing or stereotyping gender, and limit individuals’ conceptions of masculinity and femininity, of doing and being a boy or a girl or a male or a female (Paechter, 2012; Skelton and Francis, 2011). When scrutinized, the “ideal (neo-liberal) pupil” is actually associated with binary and stereotypical male and female characteristics (Skelton, 2010; Skelton and Francis, 2011).

Performing successful masculinity or being the “proper boy” often entails devaluing academic achievement, particularly literacy achievement. Academically successful boys can rework this image while still maintaining their hetero-sexualized gender position by other accomplishments and behaviors, such as being good at sports and playing computer games with friends (Skelton and Francis, 2011). The “all-rounded” boy incorporates and negotiates feminine traits in producing a “powerful mode of masculinity” (Skelton and Francis, 2011, p. 471). These “feminine” traits are accepted because they carry social capital within schools and in workplaces.

Boys typically need to navigate what is “allowed” and what counts as masculine while girls are more enabled to explore behaviors aligned with masculinities (Paechter, 2012).

It has been tacitly accepted in education and in the media that “naturally” girls would do better in reading and language-related subjects and boys would perform better in subjects like mathematics and physics (Barrs, 2000). In the latter decades of the 20th century, the reasons for girls’ lack of confidence were identified as aspects of their schooling that formed the “hidden curriculum” (Spender, 1982), including representations of males and females in books and textbooks (or their lack of representation) and teachers’ differential attitudes and expectations in their interactions with boys and girls (Callahan and Nicholas, 2019; Skelton, 2010). For example, researchers, teachers, and students have noted the lack of representation of women and girls in science textbooks, particularly in illustrations that showed only men in science careers (Guzzetti and Williams, 1996a,b), sending subtle messages to students that science is the work of men.

In addition to their differential expectations, teachers’ educational practices, co-educational classes, activities, and texts may not meet diverse students’ needs. Due to the large number of white and middle-class female teachers who may themselves identify as *trans*, queer etc. in American schools, curriculum and instruction may be considered as too feminine to gain boys’ interest and motivate them to succeed (Bean and Ransaw, 2013; Martino and Kehler, 2007; Skelton, 2010). “Boy-friendly” approaches based on gender stereotypes of their interests and learning styles, such as providing boys with books about sports and kinaesthetic learning approaches, may let boys down as these interventions frequently do not challenge boys intellectually (Skelton and Francis, 2011). Kosciw et al. (2020) noted that students who identify as lesbian, gay, bisexual, transgender, or queer (LGBTQ+) typically experience a negative environment in school and are at greater risk of underperforming than their heterosexual peers. Students of color and LGBTQ+ students typically do not see themselves represented in the curriculum and consequently feel alienated from literacy engagement and performance.

Teachers’ stereotypical or gendered expectations for literacy performance for boys and for girls may result in differential literacy achievement and engagement. Researchers have suggested that teachers can reinforce gender stereotypes by having lower expectations for students’ literacy performance and mirror the stereotypical and limiting views and values presented regularly in the public media as accepted and unchallenged (Sanford, 2005, p. 307). The rhetoric of boys as disadvantaged can feed into “teachers’ taken-for-granted assumption that boys require more time in class, require more discipline, are behavior problems, are poor at expressing their emotions, and are not good at reading” (Lingard, 2003, p. 43). Sanford (2005) noted that teachers’ expectations reinforced stereotypical views of boys’ and girls’ literacies, such as who read more or who read less, and who were risk takers or not. These preconceptions can also influence the direction of teachers’ encouragement to students and the types of assignments they accept which in turn can differentially influence their students’ literacy engagement, attitudes, and performance.

It is therefore important to examine how literacy education can serve all students across all areas of the curriculum and contribute to all students’ success (Lingard, 2003; Meier and Diefenbach, 2020) and to re-examine notions of who is successful and who is not based on gender stereotypes and under-examined achievement test scores. For example, scholars have noted that girls cannot be considered to be “success stories” when their lack of self-confidence is considered rather than simply their academic achievement (Skelton, 2010). Girls are not necessarily educationally conforming or advantaged; they may not conform to acceptable classroom behaviors they are often noted for, such as being compliant and quiet when they are being assertive and active (Callahan and Nicholas, 2019; Francis, 2010). As Skelton and Francis (2011) found, despite perceptions to the contrary, there are successfully literate boys who do engage in classroom literacy activities, including discussions, reading, writing of emotionality, and empathizing with literary characters. Boys can be as prepared as girls to develop elaborate contexts for their stories. Therefore, education policies and practices should not be driven by “one size fits all” or offer easy solutions that reinforce dominant masculinity or femininity (Martino and Kehler, 2007).

Home and family conditions may also influence gender gaps in literacy engagement and achievement. These factors include differential time that parents can provide to support and reinforce their children’s learning if they are middle class or above versus if they are working class or poverty stricken (National Education Association, 2012–2015). Students of color are more likely to live in poverty than their white counterparts. For example, research from the National Center for Children in Poverty (<http://www.nccp.org>) has indicated that 62% of Latino children live in low-income families as compared to 31% of White children (Jiang et al., 2015). Latino children are less likely than other children to live in homes with a head of household with a high school diploma (Kids Count, 2014) and may lack role models of adults engaging in literacy practices and events that are aligned with school-based literacy practices (see Williams, 1998; Brice-Heath, 1983 for discussion of cultural and socio-economic family vs. school literacy practices). Researchers (e.g., Brooks, 2002; Ransaw, 2019) have identified the importance of parents who read to their children and engage with them in literacy activities as a positive influence on their children’s school literacy performance and engagement.

Assessments of male and females’ engagement in literacy

Literacy engagement is associated with and influences literacy achievement (Brozo et al., 2014). From a gender binary perspective, gender disparities have been noted in literacy engagement or involvement in literacy activities and processes that can develop knowledge, skills, and attitudes toward reading, writing and understanding and composing texts. For example, researchers analyzing the results of PISA assessments in five countries noted that not only do boys achieve less in reading than do girls, they also engage less in reading than do girls; globally and generally, girls are more engaged in reading and are better readers than boys (Brozo et al., 2014).

This gender gap in literacy engagement continues into adulthood; survey research by the Pew Research Center found that women in the United States reported reading more books than did men while gender gaps still persisted, but were less pronounced for other types of reading materials (Perrin, 2019). These findings with print reading did not carry over to reading online, however, at least not for adolescents—analysis of gender differences in online reading engagement on the 2009 ePISA revealed there were no gender differences in most countries in how engaged 15-year-old girls and boys were in online reading (Wu, 2014). While Wu (2014) found there were no gender differences in social or information-reading engagement overall, he suggested that the smaller gap in online reading might be related to boys' greater confidence and girls' higher anxiety in the electronic reading environment (p. 268). Wu also commented on the inconsistency between his finding that girls' navigation skills, measured in terms of relevant pages visited, were better than boys' in comparison to research in the online search strategies that boys have better self-reported search (or navigation) skills; given this inconsistency, he recommends that future studies examine whether such effects exist (p. 268).

Critiques of gender differences on literacy assessments and their interpretations

Numerous researchers have questioned generalizations based on the results of literacy assessments (e.g., Kehler, 2016; Meier and Diefenbach, 2020; Reilly, 2012). Meier and Diefenbach (2020) noted that the PISA's Gender Report stereotyped girls as "passively driven by parental, educational and/or general social forces beyond their control" (p. 638). Girls' mathematical issues were considered as caused by external factors, but boys' literacy issues were considered as caused by innate or biological differences and behavioral variables. These gendered interpretations have conformed to middle-class stereotypes of girls and were not deconstructed to consider the cultural and social factors that influence achievement (Reilly, 2012).

It is also important to interrogate not just the perception of a gap in literacy achievement based on male-female binaries, but to consider which boys and which girls are disadvantaged; small performance gains for mostly middle-class girls should not be interpreted as "large gains for all girls outperforming all boys" in literacy achievement (Lingard, 2003, p. 38). Lingard (2003) cautioned the interpretation of performance data by gender that essentializes the category of "boys" in informing educational practices and policies. Such discussions ignore the influences of social factors or subjectivities, such as race, ethnicity, age, culture, sexual orientation, and social class, that intersect with gender and can influence literacy achievement, performance, and engagement. The identities of boys—like girls—are not a single, coherent and undifferentiated group.

Rather, a more nuanced interpretation of test scores should consider social factors or subjectivities, such as social class, race, and geography, i.e., rural versus urban location and other social factors (Froese-Germain, 2006; Reilly, 2012) as doing so troubles sweeping generalizations. Re-examining boys' test scores has demonstrated that not all boys are failing, and education is not failing all boys. For example, although middle-class boys have been challenged by middle-class girls in "high status subjects", they still perform relatively well; middle-class boys have demonstrated higher achievement than working-class girls in literacy (Martino and Kehler, 2007) and they have outperformed boys in poverty on writing assessments (Disenhaus, 2015).

It is also important to consider assessment results for each gender in terms of race or ethnicity, as well as financial and social capital, when considering literacy achievement (Buchman et al., 2007). For example, reading achievement was lower for Hispanic and Black students than for white students on the 2017 and 2019 National Assessments of Educational Progress (NAEP Report Card, 2019). This result confirms the observation that African American boys are more likely to attain lower academic achievement than their white peers (Neal, 2003). Compared to 1998 and to 1992, however, average scores were higher in 2019 for all racial/ethnic groups (White, Black, Hispanic, and Asian/Pacific Islander students). In 2019, average reading scores were lower compared to the previous assessment in 2017 for almost all student groups at grade 8, finding that average scores were lower on the 2019 assessment than on the 2017 assessment for White, Black, Hispanic, American Indian/Alaska Native, and students of Two or More Races. Research sponsored by The Schott Foundation for Public Education (2011) predicted a 65% high school graduation rate for Latino males compared to 80% for White males for 2012–2013. This study also showed that 81% of Hispanic 4th graders were not proficient in reading as compared to the national average of 66%.

Hence, researchers have cautioned against forming educational policies and practices based on generalizations about gender differences in literacy achievement. Scholars have critiqued how the growing panic about boys is framed by educational systems in countries like the United States, the United Kingdom, Australia, and Canada based on alarmist reports in the media portraying boys as victims of radical feminists who support girls at the expense of boys' achievement (Kehler, 2016). Christina Hoff Sommers' (2000/2013) book, *The war against boys: How misguided policies are harming our young men*, was a reaction to a focus on increasing educational outcomes for girls and women given the limitations of the education system and society to adequately meet females' needs. The premise of the "war against boys" was that an emphasis on girls' education on improving the breadth of study of girls in mathematics, science, and engineering-related subjects and degrees and increasing the job opportunities that are higher paid had had the desired impact, but that there remained groups of boys who were disadvantaged because they were underachieving or also not reaching their potential. The "war against boys" was fueled by the media and by public discourse which viewed boys as the "new" disadvantaged given the "perceived" improvements for girls and women in education and work which is only a perception and not the case for all girls or women (Martino and Kehler, 2007; Skelton, 2010).

It is within this discourse that education and schooling has been framed as failing boys. This position has been critiqued as an over-simplified perspective on a far more complex situation, reflecting essentialized notions of boys and boys' learning styles and reinforcing entrenched heteronormative behaviors and roles based on dominant male stereotypes (Kehler, 2010; Lingard, 2003; Lingard et al., 2009). Foregrounding this dominant construction of boys and masculinity can also be considered as discriminatory as it "can bring enormous pressure to bear on boys significantly affecting their performance in school"

(Subrahmanian, 2005, p. 406). The rhetoric of boys as the new disadvantaged feeds into “teachers’ taken-for-granted assumption that boys require more time in class, require more discipline, are behavior problems, are poor at expressing their emotions, and are not good at reading” (Lingard, 2003, p. 43).

Scholars have cautioned educators to be mindful of “campaigns” that consider one gender over another at face value. In considering boys’ and girls’ achievement in literacy, Skelton and Francis (2011) recommended that educators need to “interrogate the media’s and their government’s emphasis on ‘boys’ as a homogenous group and to question the language suggesting a ‘crisis’ in boys’ education” (p. 473). In addition, as teachers are encouraged to focus on “poor” boys, it is important that girls’ disadvantages do not become invisible (Sanford, 2005). Lingard (2003) and Lingard et al. (2009) caution that it is a question of “which girls and which boys” are advantaged or disadvantaged that requires educational reform rather than engaging in a victim/victor dichotomy.

Literacy as a cognitive process or performance and the role of gender

Literacy as a cognitive performance focuses on a set of cognitive skills that people either possess or do not possess. These discrete skills can be taught in an appropriate sequence and are needed for learning but which for many are considered the basis of issues in literacy learning and performance. From this perspective, reading is closely associated with efficient use of perceptual skills, automatic word recognition, decoding skills and comprehension (Anstey and Bull, 2004; Farrell, 2012). As an individual acquires the necessary skills they then can apply them at the appropriate time. It takes place in the head as the individual constructs and represents meaning, usually in print-based texts (Luke et al., 2010; Street, 1984). Emphasis is on “working out the answer, engaging in the thinking process and knowing how to use comprehension skills” (Anstey and Bull, 2004, p. 127). It doesn’t take into consideration the socio-cultural background of students, the funds of knowledge they bring to school nor how these influence individual students’ understanding or achievement (Street, 1984).

Large-scale achievement assessments are based on a view of literacy as a cognitive performance employing survey research where there is only one correct answer. These assessments are intended to allow for comparisons in achievement across time with results typically analyzed for subgroups by age, gender, race, and other social factors. As such these assessments are conducted from a binary view of gender and continue to reinforce gendered assumptions and expectations of literacy achievement.

Gender differences on US National Assessments

In the United States, achievement assessments have tended to indicate that boys have higher test scores in mathematics while girls have higher test scores in English, specifically reading (Buchman et al., 2007; Kollmayer et al., 2018). Gender differences favoring girls have been consistently demonstrated in students’ performance and in students’ motivation (Kollmayer et al., 2018). Researchers have discovered that in the early years of schooling, girls and boys have similar performances in reading, but gender differences in scores increase as students move through school and persist on college entry tests, such as the SAT (Buchman et al., 2007). Literacy researchers have also noted a gender gap in writing (Newkirk, 2000) as well as in reading achievement (Watson et al., 2010) discovering that, from a binary perspective, boys consistently lag behind girls in literacy performance.

The most widely recognized literacy assessment that examines gender differences in literacy achievement conducted in the United States is the National Assessment of Educational Progress, (NAEP), a project of the National Center for Education Statistics (NCES), a section of the United States Department of Education. The NAEP is a national achievement survey used to track student achievement over time in 4th, 8th, and 12th grades at the state and national levels by measuring students’ achievement in reading, writing, mathematics, science, and other subjects. Results are reported after each assessment as The Nation’s Report Card.

Analyses of these assessments have consistently demonstrated that girls outperform boys in literacy. Reilly et al. (2018) examination of data from three decades of NAEP assessments conducted from 1988 to 2015 in reading achievement and from 1988 to 2011 in writing performance, demonstrated that girls showed significantly higher reading and writing scores than boys in every wave of the assessment at every grade. The gap between girls’ and boys’ achievement in reading was greatest at grade 12 with the magnitude of these gender performance differences demonstrated to be higher in writing than in reading. The authors listed five possible explanations of these gender differences in literacy achievement, including differential maturation rates; differences in lateralization of brain function; greater male variability effect; gender differences in language competencies and behaviors; and gender stereotyping of reading and writing as feminine pursuits. Reilly et al.’s (2018) analyses and five possible explanations highlight the limitations of large-scale assessments that view literacy as a cognitive process, reinforcing binary gendered perspectives of literacy achievement.

Gender differences in international assessments

These gender gaps in literacy achievement are also evidenced in educational assessments and outcomes internationally, which similarly reinforce binary discourses associated with achievement. On a global scale, The United Nations Educational Scientific and Cultural Organization (UNESCO), a program of the United Nations dedicated to providing global leadership in education; strengthening educational systems worldwide; and responding to global challenges through education and gender equality (<https://en.unesco.org/themes/education>) reported that boys are more likely than girls to underachieve and drop out of school (UNESCO, 2012). Boys of color and those from poor or working-class families were found to be more likely than their White or middle-class peers to be academic underachievers compared to their female peers (UNESCO, 2014).

UNESCO defines literacy as “the ability to identify, understand, interpret, create, communicate and compute, using printed and written materials associated with varying contexts” (Montoya, 2018) and characterizes literacy as “beyond a set of reading, writing and counting skills [and as] a means of identification, understanding, interpretation, creation, and communication in an increasingly digital, text-mediated, information-rich and fast-changing world” (<https://en.unesco.org/themes/literacy>). From that definition, UNESCO has conducted a Literacy Assessment and Monitoring Program (LAMP) every 5–10 years in six countries (El Salvador, Kenya, Mongolia, Morocco, Niger and Palestinian Autonomous Countries), discovering there were 773.5 million adults identified globally who were categorized as functionally illiterate in 2013. In contrast to other UNESCO findings, LAMP found of that number, 63.8% were women. 123.2 million children were considered illiterate and 61.3% of them were girls with the highest rates of illiteracy evidenced in South and West Asia and Sub-Saharan Africa (UNESCO, 2013). While there may be international global comparisons for differences in literacy achievement for boys and girls, in some countries females do not have access to education at all.

The International Association for the Evaluation of Educational Achievement also administers a global achievement survey analyzed by gender, the Progress in International Reading Literacy Study (PIRLS), which commenced in 2001 and has been administered every 5 years as a comparative international measure of 4th-grade students’ reading comprehension. This assessment is undertaken so countries can understand how successful they are in preparing students to read, understand, and interpret information (Warner-Griffin et al., 2017). The 2016 achievement survey was conducted in 58 countries and included an additional ePIRLS as a measure of online reading comprehension. Gender gaps in achievement have been revealed by these assessments with girls consistently outperforming boys in reading comprehension across nations (except for Macao, SAR, and Portugal where achievement in 2016 was equal) in 2011 and 2016 (National Center for Education Statistics, 2011; Warner-Griffin et al., 2017).

The Organization for Economic Co-operation and Development (OECD) conducts an additional international literacy achievement assessment analyzed by gender, the Program for International Student Assessment (PISA). This assessment is conducted to assess the academic performance of 15 year-old students across nations, comparing students’ achievement in literacy, mathematics, and science (Office for Economic Co-operation and Development (OECD), 2014, 2019). Although a gender analysis was not reported for the 2018 assessment published in 2019, the 2015 PISA Gender Report (Office for Economic Co-operation and Development OECD, 2015) examined academic performance by gender by using data from the 2012 PISA. On this assessment, girls achieved lower scores in mathematics than did boys while boys achieved lower scores in literacy than did girls. The advantage of boys in mathematics was consistently three to four times lower than the advantage of girls in literacy; the mean score was 11 points in favor of boys in mathematics and 38 points in favor of girls in literacy. The 2009 PISA assessment demonstrated that girls outperformed boys in reading literacy consistently across all nations with the United States showing the largest gender gap in reading achievement (Reilly, 2012). Analysis of gender differences in online reading on the 2009 ePISA revealed that girls performed better in metacognitive strategies and online navigation than did boys (Wu, 2014). However, caution needs to be applied by educators and governments in employing these gender-based assessment reports for changes to educational policy and practices as they report from a binary perspective and limited, if any, social considerations.

Literacy as social practice and the role of gender

A plethora of research on gender and literacy has been conducted from a view of literacy as a social or sociocultural practice (Gee, 1992; Street, 2014). Research from this perspective examines literacy as more than just a set of cognitive skills that people either possess or do not possess, but as a social activity or what people do. This perspective allows for the study of how and why people engage in literacy practices or events. Barton (1994) explained, “Literacy is not simply knowing how to read and write a particular script but applying this knowledge for specific purposes in specific contexts of use” (p. 24). Literacy is a part of a wider set of communicative practices that embrace oral, written, and visual communication and communicating for a purpose. People engage in literacy practices within their social networks that serve as resources for exchanging knowledge and skills in which individuals are treated as equals and not as “literate” or “illiterate”. In this view, literacy is always contextualized and situated within specific sociocultural settings. Individuals’ literacy practices are embedded in their social goals and cultural practices (Barton et al., 1999). Meaning is made through situated practices and interpretations, designing texts by using resources from multiple modes and representational features in everyday life (Jewitt, 2014).

Gender and socio-cultural literacies

Literacy research on gender conducted from a social or sociocultural perspective tends to recognize that there is no single “literacy” but “literacies”. There is not one universal application of literacy; rather, there are different literacy practices for different groups (e.g., members of specific organizations or occupations), for different kinds of activities (e.g., engaging in education or practicing religion), and for different social and institutional contexts (e.g., informal meetings or academic occasions). These literacies are not confined to reading, writing, listening and speaking, but include a range of multimodal textual productions, including aural, visual, print, and digital communications. Multiple modalities suggest the interrelationship between various modes of meaning, including written and spoken words, pictures, graphics, and auditory and spatial modalities (Cope and Kalantzis, 2009). Practices of the “new literacies” are those literacy practices that are chronologically new and constitute socially recognized ways of generating,

communicating, and negotiating meaningful content (Lankshear and Knobel, 2011) and are characterized by an ethos of participation, collaboration, and distribution of content (Knobel and Lankshear, 2001). These practices may be in print or digital form.

Social and cultural constructions of gender

Research conducted from the perspective of literacy as a social or sociocultural practice was informed by social and cultural constructions of gender. Such theories recognize the nuanced and relational context of lived experience where individuals have agency to overcome hegemonic views of gender and challenge dominant notions of gender and literacy performance (Bean and Harper, 2007). Gender theorists, such as Judith Butler, (1990, 2004), noted that the performance of gender is fluid and may change within contexts and social settings or over time. Masculinity and more broadly, gender, are social constructions rather than biological designations, constituting identity performances amenable to critique and change (Bean and Harper, 2007). The terms “masculinities” and “femininities” recognize myriad ways of doing gender that extend beyond gender binaries.

Feminist and gender theorists (e.g., Stanley and Wise, 1993) recognized that other subjectivities or social factors, such as race, culture, social class, age, sexual orientation, and geographical location interact with gender and influence gender representations in literacy practices. Intersectionality or intersectional feminist theory, a perspective developed by Crenshaw (1989, 2016) and applied in literacy studies of girls and women (e.g., Hinchman and Alvermann, 2019), extended this theory, noting that unique points of oppression stem from the intersection of two or more of these subjectivities.

Gender and literacy practices: those who identify as female

Since the advancement of the view of literacy as a social practice in the mid-1990s numerous noteworthy studies, undertaken from a frame of binary gender at the time, identified and described the literacy practices of those who identify as girls and women in school, home, and out-of-school settings, describing the functions that literacy served in their lives as females; we highlight a few of them here that focused on their consumption and production of texts. One of the first of these that examined how girls consumed texts was Margaret Finders' (1996) investigation of preteen girls who subscribed to, read, and shared popular commercial magazines aimed at young women. Her study identified how teen girls use literacy for their own purposes; how literacy practices assist girls in monitoring and achieving social roles and statuses; and how social groups regulate literacy practices. Finders' research extended Meredith Cherland's earlier (1994) study of how preteen girls read fiction to construct their identities, one of the first studies in literacy to illustrate gender as both a cultural and a social construction. These studies were informed by ethnographic research from the prior decade conducted by Shirley Brice Heath (1983) that examined local communities' ways with language and literacy and described how girls' literacy practices were limited and shaped by local cultural norms.

The concomitant development of new technologies, the advent of Web 2.0 capabilities, and an emerging line of inquiry on the new literacies stimulated researchers' exploration of girls' textual production with various participatory media. Barbara Guzzetti (2006) described how a young woman was marginalized by males in participating in a male-dominated online discussion forum for punk rock fans. Olcott and Mahar (2003) explored early adolescent girls' construction of identity texts in online communities creating fan fiction, fan art, and web sites, and their participation in electronic mail discussions that focused on Japanese animation (anime), finding that a girl who had benefited from online mentoring herself was hesitant to share her expertise with HTML coding and become a mentor for other girls for fear of being labeled “geeky”. Elisabeth Hayes (2013), again from a binary perspective, described how the identities and literacies practices of video gaming continue to be gendered with more boys playing games and participating in the gaming community than girls and games having more genres and gendered storylines that appeal to boys. Guzzetti and Gamboa (2005) investigated adolescent girls' online journaling, discovering that writing online facilitated the girl's identity formation and independence, empowering them to express intense emotions and ideas in a safe space for an authentic audience they designated. Guzzetti and Gamboa (2004) also described how adolescent girls authored and edited zines, do-it-yourself, self-published alternatives to commercial magazines, compiling entries from their classmates to deconstruct stereotypical notions of gender and social class performance. Barbara Guzzetti, 2013 investigated women's zines as a global literacy practice, describing how marginalized women in prison authored zines as a strategy to resist oppression of difference and loss of voice stemming from incarceration and from society's views of women doing time.

Literacy researchers have also included girls and women of other marginalized populations in their studies of identity texts. A foregrounding study by Pat Rigg (1985) identified gendered cultural beliefs about women's roles that limited a low-income woman who was a monolingual Spanish-speaking Mexican migrant worker in gaining basic literacy skills of reading and writing in either English or Spanish, but eventually learning to write her name which she wrote on all her possessions, a simple text of identity created by a literacy practice that allowed her agency and voice. Decades later, Mellinee Lesley (2012) explored preadolescent Latina and African American girls from low-income backgrounds writing in an environmentally safe “third space” between home and school, discovering that girls need instruction in critical literacy skills to interrogate texts and resist dominant and discriminatory ideologies in writing and reading online and off line. Rubinstein Avila (2007) described how an immigrant girl from the Dominican Republic learned to do gender by reading popular magazines. Muhammad and McArthur (2015) investigated black adolescent girls who identified and wrote against stereotypical portrayals of black girls as sexualized and as angry, loud and violent, images that dominate popular culture media and echoed the need for critical media literacy. Jong Kyeong Jung (2019) investigated Korean American women's participation in an online discussion forum, writing online to actively respond to the #MeToo and #WithYou digital social movements, engaging in practices of the literacies to effect social change and refute gendered notions of Asian women

as passive and silent. Barbara Guzzetti (2022) described how a Navajo woman created semiautobiographical stories in personal zines and social media to refute notions of Native Americans as a dying people, change stereotypical notions of Navajo women as squaws or princesses, preserve the Diné language, and share cultural customs through stories with contemporary settings.

Gender and literacy practices: those who identify as male

Following the development of the theory of literacy as a social practice in the mid-1990s, numerous noteworthy studies, also undertaken from a frame of gender as binary, identified and described the literacy practices of boys and men in school, home, and out-of-school settings, describing the functions that literacy served in their lives as males; we highlight a few of them here that focused on their consumption and production of texts. William Brozo (2013) described how early adolescent boys bridged the gap between their in-school instruction and their out-of-school interests by bringing in music lyrics and writing their own song lyrics during word study. In another investigation exploring a boy's reading of and reaction to popular culture texts, superhero comics were compared to classical literature, Cassidy and Kehler (2019) found an adolescent boy noticed the gendered images of hypersexualized women in these texts. In a study of adult men's online literacies, Erik Jacobson (2019) discovered toxic masculinity in men's discussions in online sports-news comment boards that were dominated by men, including expressions of homophobic language, explicit misogyny, and cuckoldry as insult that men used to demean others, describing how some men pushed back against these protean discourses in their online writing.

These studies are a reminder of the importance of the role of masculinity in relation to literacy, particularly as reasons why and how boys and men engage or do not engage in literacy practices and how they marginalize others as a result of their views. As noted by Smith and Wilhelm (2002) in their comprehensive review of the research on boys and literacy, the Australian scholar, Wayne Martino (1995) argued that hegemonic versions of masculinity in which boys see literacy as feminized and define maleness as being "not female" are inconsistent with being literate. Researchers have also found that adolescent boys' views of masculinity as superordinate over females plays a role in marginalizing girls' contributions to class discussions when boys interrupt and ridicule girls in small-group and whole-class discussions, and dominate talk about science concepts and texts (Guzzetti and Williams, 1996a,b).

Other researchers exploring the literacy practices of boys and men examined the multiple subjectivities of gender, race, and culture in their literacy development and practice. David Kirkland (2013) described how Black men engaged in the production and construction of texts, such as song lyrics and poetry that refute stereotypical notions of Black men and the enactment of Black masculinity as hypermasculine and cold. Theodore Ransaw (2019) interviewed African American fathers, finding that they enjoyed reading to their children daily and engaged them in a variety of literacy practices, including reading newspapers and the Bible and using dictionaries and thesaurus, as well as Smartphones and apps for literacy development and support, refuting stereotypical notions of African American fathers as distant and uninvolved in their children's literacy development. Guzzetti and Foley (2017) detailed how a Chicano man authored and edited multiple issues of a zine, *Rad Dad*, that refuted stereotypical notions of men and the masculinities displayed by men of Latin descent as macho/machismo, highlighting their active parenting. Guzzetti and Lesley (2017) detailed how an African American man refuted stereotypes of African American men as aloof hypermasculine and by writing a zine that presented alternative constructions of masculinity and fatherhood. Barbara Guzzetti (2019) described how a Navajo man created fictional stories in zines that illustrated the view of two spirits (male and female) and four genders (feminine female; masculine female; masculine male and feminine male) that inhabit each person, a theory held by some Navajos.

Literacy practices: beyond the binary

A growing line of inquiry has been undertaken reflecting gender and gender performance in literacy development and practice beyond binary views of gender. Jennifer Ingrey (2013) investigated the online writing practices of youth participating in a teen forum on Laura's Playground, a "Transgender Umbrella Resource Community Online", (<http://www.outproudandhealthy.org/2013/lauras-playground>), describing a discussion thread billed as a short story authored by a transgender teen living as boy/man that traced his transition journey. Simon et al. (2019) described how adolescents constructed a music video that critically rewrote a *trans* young adult novel, resisting stereotypical portrayals of female characters in the story and challenging gender expectations.

Mollie Blackburn (2002) described the literacy performances (a poem, *Pride*, and a video, texts of resistance against heterosexism and homophobia) created by an African American teenager who self-identified as a lesbian in the context of a youth-run center for LGBTQ+ youth. Jon Wargo (2017) explored how LGBTQ youth navigated Tumblr, a social media platform known for fostering spaces for socially marginalized users, describing the processes, modes, and social tactics youth used when writing the #socialjusticewarrior self, such as reblogging others' posts to combat and critique homophobia; remixing to advance racial justice; and tagging posts to educate others. Wargo (2015) also explored how LGBTQ youth constructed digital photos of themselves (selfies) and their online writings that served as textual artifacts of identity on Tumblr that allowed them to centralize their sexuality and gender. Oakley (2016) similarly explored the role of Tumblr in disrupting hegemonic public discourses associated with nonbinary genders and sexual orientations, including "heterosexual" as the default sexuality. She found that users "experience freedom specifically related to gender and sexuality" (p. 7) and constructed their identities through their creative use of Tumblr affordances particularly through a combination of bios: About Me pages, blog posts and tags on the posts.

Recommendations for future research on gender and literacy

Our review of the extant research on gender and literacy has led us to recommend that more investigations be conducted that focus on the literacy practices of diverse populations, and from a non-binary position. More studies need to be conducted on how members of marginalized groups engage in literacy endeavors and for what purposes they do so. Few studies have paid careful attention to issues of gender, race, social class, and sexualities and how these intersectional identities shape and are shaped by literacy development and practices. Without such nuanced studies that attend to these subjectivities, there is a danger of essentializing.

Relatively few studies focusing on gender and literacy that also attended to race and culture have been conducted. More distinctions need to be made among members of various racial and cultural groups, as well. We are reminded, for example, that studies of a Navajo man's literacy practices do not represent all Native American men just as studies of Korean American women engaging in literacies do not represent all Asian American women. Therefore, there is a relative paucity of research on the literacy practices of men and women of various Asian descent or those from Indigenous or Native American groups. Additional inquiries are also needed to explore the ways in which members of the LGBTQ+ community represent and explore gender and sexualities through literacies. It is our hope that future researchers will fill these gaps in the extant research and undertake studies that promote understandings of various ways of doing gender, race, and social class to advance a line of inquiry for gender and social justice.

Learning with(in) white and straight places

Many US institutions founded in the name of citizenry, faith, education, and “public good” rely on racist, classist, and cishetero-normative ways of becoming in order to create productive members of society. Primarily, racial and Christian hegemony operate within societal institutions that shape a pervasive and systematic set of values and beliefs that, in turn, teach the public about who is good, what is (in)appropriate, and who deserves access. Systems of racial, class, gender, and sexuality oppression make possible the normalization of practices that disrupt educational and social opportunities for African American and LGBTQ people. Further, these systems legislate, miseducate, and relegate them to the margins of society and acceptance. Many schools in the US, for example, reify hierarchical structures that support the reproduction of ideas and ideals in order to maintain order, impose regimented activity, and surveil text, bodies, and actions that threaten that order. These structures make possible the “academic” discourses that deny students’ funds of knowledge (Moll et al., 1992); discourses of standardization that marginalize language; discipline discourses that push Black and Brown bodies out of classrooms and schools; and discourses of silence where queer, trans, differently abled, and people with other nonconforming identities are denied spaces to exist and thrive with(in) the structures of school.

Through racist, heteronormative, and homophobic discourses (Blackburn, 2005), schools (re)create practices of violence against the “othered” while teachers inherit violent language that regards particular bodies, namely Black and queer, as dangerous and pathological. This violence is apparent with(in) literacy practices that “correct” African American Language speakers, only teach and center canonical (and canonical-like) texts, and stifle identity- and meaning-making through writing and other forms of literacy participation. Such practices perpetrate violence in the name of standardization and “academic” achievement while perpetuating the identities, values, and beliefs embedded within those practices. Namely, that ways of knowing and being that fall outside of straight, white, American English, and Christian are subject to oppression, injustice, and inequity.

According to Johnson (2017), “Educators are in need of theoretical and pedagogical models in which restorative literacies are enacted in order to undo the violence against and silencing of [African American] queer youth that happens in US schools” (p. 30). We draw on Pritchard’s (2017) notions of normative and restorative literacies for Black queer people to offer such a theoretical model, and we review empirical literature to explore how and where literacy normativity impacts the literate lives of Black queer youth, and other queer youth of color in the US. Moreover, we illuminate the ways that the youth represented in these studies used literacy to link their racial, gendered, and sexual identities in ways that challenged normativity. We illuminate the ways they engaged in restorative literacies as a promising pathway toward enacting pedagogies and practices of transformation and healing for themselves, as Black and queer youth of color specifically, and all youth, writ large.

Literacy normativity, Black queer literacies, and restorative literacies: theoretical considerations

In his book on Black queer literacies, Pritchard (2017) defines literacy normativity as “the use of literacy to create and impose normative standards and beliefs onto people who are labeled alien or other through textscapes that are experienced as painful because they do damage or inflict harm” (p. 28). Pritchard asserts that

[I]literacy normativity steals emotional resources from people, wounding people through texts. Moreover, literacy normativity places limits on what is considered literacy and who is considered literate. Not only does literacy normativity make possible harmful discourses that “marginalize, ostracize, and condemn people for their identities and other ways of being” (p. 28).

It also operates to leave out, dismiss, and correct voices of the “othered.” In intellectual spaces, (e.g., academia, scholarship, schools), literacy normativity plays out in the ways that prioritize particular voices that echo white, heteronormative, standardized, and middle-class ways of reading, writing, using language and other literacy events (see [Heath, 1983](#)) and dismisses opposition to normativity as extracurricular, nonscholarly, artistic, and/or personal.

Queer pedagogies provide the space to reimagine literacies in that it leans on criticality and invites us to think about queerness in relation to teaching the English Language Arts. In their positioning queerness as more than being connected to queer texts, students, or teachers, [Waite \(2017\)](#) considers “queer forms” as:

non-normative and category-resistant forms of writing that move between the critical and the creative, the theoretical and the practical, the rhetorical and the poetic, the queer and the often invisible normative functions of the classrooms (p. 6).

Such underpinnings provide us with ways to interrogate Black queer literacies and understand them within the context of literacy teaching and literacy practice. In order to argue the harm of literacy normativity, we consider Black Queer Literacies as antinormative praxis ([Pritchard, 2017](#)) as they provide an intersectional landscape for understanding how, when, and for what purposes literacies are racialized, gendered, and sexualized. In addition, Black queer literacies provide space to interpret radical praxis of freedom, love, healing, and transformation in the face of “social, political and cultural circumstances in which [people reading and writing, doing/being literacy from the margins] are targeted for debasement, degradation, and in many cases, death” (p. 37). They are, in Pritchard’s words, restorative.

Whereas literacy normativity’s pervasive nature has a hold on all people reading and writing ([Yagelski, 2011](#)), especially in school, restorative literacies are used to subvert dominant ways of doing literacy and being literate as well as to “remak[e] those emotional resources people need for living, especially love, and retur[n] them to work in the best interest of the individual and others” ([Pritchard, 2017](#), p. 24). Restorative literacies invite literacy participation that centers the self ([Johnson, 2017](#)), asserts control over one’s life and voice with, through, and in literacy action and participation ([Johnson, 2017](#); [Pritchard, 2017](#)). Thus, they are associated with choices about language and identities ([Daniell, 1999](#); [Pritchard, 2017](#)).

In the following sections, we focus on Black queer literacies to consider sites of both normative and restorative literacy practices for queer youth of color. We use empirical scholarship to illuminate literacy practices that perpetuate as well as challenge racism and cisheteronormativity and conclude with a discussion that addresses the question(s): What are the consequences of taking up queer in sites of learning? And how does taking up queer (in literacy practice) benefit all students?

The literate lives of queer students of color: empirical scholarship

We turn to educational literacy research about Black queer students, as well as other queer students of color, to explore what normative and restorative literacies look like in the lives of these young people as they navigate spaces in and out of schools. We explore how scholars have interrogated spaces, texts, and literacy practices in order to illustrate how normativity and restoration look in the lives of Black queer youth and other youth of color. Additionally, we analyze this literature in order to illuminate the ways that normativity of spaces, texts, and literacy practices work to dehumanize, debase, and destroy people who identify as queer and how transformation and liberation are possible in and through restorative literacies.

Sites of normativity

In educational literacy scholarship focused on Black queer students, normative literacies are reported as taking place in schools. [Schey \(2020\)](#), for example, introduces readers to Imani, a “young cis Black woman” who identifies “variously, as bi, bi-curious, and questioning” (p. 17); Schey reported that when queer topics were raised in Imani’s sophomore humanities class, they often led to conflict, which provoked the teachers to put an end to them. [Johnson \(2020\)](#) introduces readers to Nilah, an “African American female who named her sexuality as fluid” (p. 641). Johnson noted that there were places at Nilah’s high school where “students are taught not to love who they are, to feel ashamed” (p. 635). Even in the “LGBTQ continuation school,” where [Cruz \(2013\)](#) conducted a study of queer youth of color, the “[c]urriculum that dealt with LGBTQ issues was additive, or surface ... an in-depth examination of LGBTQ literature and lives” (p. 452) was not prioritized. Instead “worksheets dominated most units and lesson plans, [and] very little teaching happened” (p. 453). Not surprisingly, given such realities, Justine, an African American lesbian, explained to [Blackburn \(2002/2003\)](#) that there was “nothing in [her] school journal” (p. 316).

This does not mean that normative literacies only happen in school. They don’t. Such literacies for queer youth can happen at home, when a family member, particularly a parent, embodies homophobia. We saw evidence of this when Nilah, who was in [Johnson’s \(2020\)](#) Creative Writing class, where Johnson provided Nilah with a “safe space for her to question her sexuality” (p. 645). Nilah’s mother called the principal and insisted that Johnson “stop filling her daughter’s head with ‘ideas’” (p. 644). Nilah’s mother’s intervention essentially ended the teacher-student relationship between Johnson and Nilah in which Nilah could explore her sexuality through journal writing, and Johnson could listen, read, and support her. Kira, who identified as a biracial dyke, had

a journal where she grappled with her sexuality, too, but when her foster mother found it, her mother mistreated her until Kira left home (Blackburn, 2003). In these cases, normative literacies were at the homes of these youth.

Social media can also be a site for normative literacies. Consider Zeke, an “African American gay male” (Wargo, 2017a, p. 564). In his high school’s Gay Straight Alliance meeting, Zeke shared a photo he posted on Tumblr that was of a basketball jersey with his name and the year he would graduate from high school. It certainly conveyed a certain version of Black masculinity, as Wargo explores. Zeke explained to Wargo that he used the post “as a way to identify himself as ‘... not one of those loud gays’” (p. 566), indeed in and beyond the post, Zeke performed “gestures of cisgendered masculinity purposefully erasing the queerness” (p. 566). Clearly, normative literacies are not limited to schools.

Subverting sites of normativity

However, neither are schools limited to normative literacies. Indeed, we see evidence of this fact above, when we get a glimpse into Johnson’s classroom in the predominantly Black school where she works as a professor-in-residence. In her Creative Writing class, Johnson (2020) encouraged Nilah to explore questions of her sexuality in her journal and “listened (and read) and provided support for [Nilah’s] struggles” (p. 644). Indeed, Johnson was explicit about her purpose to “inform, awaken, transform, mediate, support, advocate and nurture” in her class. She was deliberate about her purpose to begin and end with love. Clearly, Johnson (2020, 2017) embraces and embodies restorative literacies.

Even in the absence of such powerful teachers, queer Black students engage in restorative literacies (Blackburn, 2002/2003; Cruz, 2013; Schey, 2020). Even when teachers did not invite them in, as Johnson did, students in these studies transformed their experiences in ways that aligned with their identities and ways of being. They rejected normative literacies that excluded or erased them and created restorative literacies that represented and elevated them. There were risks associated with such actions, and they did it anyway. Justine, for example, produced an assignment for her television class in which she read a lesbian-themed poem written by a lesbian author and complemented the poem with images of women who have loved women over decades and, finally, an image of her girlfriend and herself (Blackburn, 2002/2003). Kira wrote a gay-themed poem, story, and book report to fulfill school assignments, even when she was barely able to attend school because of the homophobia she encountered both at school and home (Blackburn, 2003). Cruz (2013) documented a video poem workshop in the high school where she worked. In this workshop, at least six queer students of color produced, shared, and discussed video poems that highlighted their sexualities, but Cruz focused on one Latino student in particular. Peter John Cord explored how his twin brother engaged in survival sex and died of complications related to HIV/AIDS only the year before. Cruz (2013) states that

[cen]tering the stories of LGBTQ youth in video means that students begin with their own stories, write their own books, read each other’s poetry, create their own cultural artifacts. To center the histories of LGBTQ lives is ... about providing a counternarrative ... where young people are not without agency but instead reveal narratives of resiliency and hope. It is life affirming to use video to tell a critical story of LGBTQ youth of color survival and resilience (p. 453).

Such literacies are, in other words, restorative.

In these situations, for these young people, teachers assigned particular formats but invited students to select topics. Choosing a queer topic can be risky, particularly in cisheteronormative schools, as most are. Therefore, it is worth turning our attention to times when teachers initiated queer topics in classrooms and considering the consequences, particularly for Black queer youth. You will recall, from above, that Imani’s sophomore humanities class was one where queer topics were raised by the teachers. Although discussions pertinent to these topics were often shut down, as indicated above, they were not always. For example, the teachers initiated a discussion of “North Carolina’s House Bill 2 (HB2)—more commonly known as the *bathroom bill*—a law then in effect that mandated transphobic state practices and prohibited municipal legal protections for LGBTQ people” (Schey, 2020, p. 17). The class was to debate the bill, and Imani was assigned to assume the role of lawmaker George Holding and therefore argue in support of the bill. One might expect this assignment to epitomize normative literacies, and it could have, but Imani rejected that possibility and asserted a subversive alternative: “She inhabited the role, but she interjected a critical difference ... She used humor and hyperbole, resulting in parody ... [to] reveal the absurdity of Holding’s transphobic views” (pp. 20–21). Thus, Imani shifted what could have been an LGBTQ-inclusive lesson with a normative impact into one with a restorative, and in Schey’s (2020) words, “liberatory” (p. 32), effect.

We also see evidence of restorative literacy events outside of school. Johnson (2017), for example, facilitated an after-school writing club at the same school where she taught Creative Writing. In this club, Black queer students “navigate[d] and disrupt [ed] heteronormativity” and “(re)claim[ed] who they [we]re through their writing” (p. 13). Ava was among those students. He identified as an African American bisexual male, and in his journal, he:

critiqued the heteronormative expectations of the people around him and bore witness to his inability to embody his true self. He used the act of writing to trace the pain of being still, not moving in the ways that made him who he was (p. 25).

Sanavia was also among these students. She identified as a gay African American gender-nonconforming female who said, “writing in my journal just makes me feel better” (p. 25). According to Johnson,

The act of writing the self freed [Sanavia] from the constraints of writing and allowed her to explore her experiences and confront the painful feeling associated with those experiences. Writing in this way also enabled her to restore her sense of self as she admitted that she was able to make it despite her experiences and pain (p. 27).

Anika, another student in the club, identified as a Black queer female. She found, in her journal, that she could “keep it real ... even when it hurts” (p. 27). In this context, she “rewrote herself—her love for another female and her gender nonconforming dress—as normal” (p. 28). Thus, these Black queer youth were able to engage in restorative literacies through their journal writing in an afterschool club.

For some Black queer youth, it is their private journals that created such space. While there was nothing in Justine’s school journal, as noted above, she kept a robust personal journal. It was, in her words, “just [her]” (Blackburn, 2002/2003, p. 316). She read a poem she wrote in it at a literacy group called “Story Time” in an LGBTQ-youth center. The poem represented a threatening interaction at a Pride parade, but in the poem, she was safe. She could fight back. When she read it aloud to her peers at the youth center, they were respectful, they laughed, they applauded. They participated in her restoration via literacies.

In the same youth center and group, a group of students read “Am I Blue?” (Coville, 1994). Among those in the group were Katrina, a young African American trans woman, and Trey, a young African American gay man. In the story is a character named Butch who is violently homophobic but who eventually is outed as gay. This prompted a discussion between these two teens, in which Trey talked about someone at school who reminds him of Butch. This classmate “bothers” Trey, even though he is not out at school. Katrina assured Trey that the classmate was gay. Trey did not seem to accept Katrina’s interpretation until she said, “I’m not going to lie, I did it too. Before I came out. I used to pick on people who were flamey, I used to pick on them ... just because it was so hard for me to come out” (Blackburn, 2005, p. 410). By reading and discussing this story, Katrina was able to help Trey see that the abuse he was experiencing in school revealed as much about the abuser as it did about him. In this way, Katrina helped restore Trey in this queer-friendly context, even if not in school.

This is not the case for all queer-friendly places, which, like any places, can be racist. Kira, for example, used to go in read at a café and bookstore in the “gayborhood,” as an alternative to going to school, before the youth center opened. She would read, seeking images of herself in an effort to figure herself out. She read biographies and autobiographies, and one time she was particularly enthusiastic about a collection of lesbian monologues, since she facilitated the “Thespians and Drama Queens” group at the youth center. She found it at the local feminist and queer bookstore, but when she realized that there was only one monologue about a Black woman, and it was a slave story, she decided the book did not represent her at all. It was, in her words, “lame” (Blackburn, 2003, p. 8).

Online communities provide another space in which Black queer youth can seek restoration by engaging in literacy practices, even though we know that can also be normative, as we saw evidence of in Zeke. But Zeke, later, posted an account of his “First High School Crush” on social media (Wargo, 2017a, p. 572). In doing so, he centered his sexuality and gender and used technology to “speak back to and provide counter-narratives of being schooled while holding the youth identity of ‘black urban student’” (p. 569). Ultimately, Zeke, “maneuvered across topographies of visual representation to write a self that felt most real” to him (p. 576). Further, Gabe, who identified as an African American and gender queer, livestreamed a photo mashup of his face on a model wrapped around Justin Bieber. They explained, “I want to show people my sexuality. This is the only way I can” (Wargo, 2017b, p. 150). The importance of this was underscored by their saying, “you can’t be Black and gay [at this school]; you unfortunately just have to pick one” (p. 151). According to Wargo, Gabe, among others, used “multimodal (counter) storytelling” to “stitch[h] together hurt, angst, desire, and (in)equality” in ways that “rendered knowing and being and for being known differently” (p. 158). In these ways, for these young people, multimodal literacies were also restorative ones.

When we reflect on these young people’s literacy events and practices in and out of schools, we see not that some events and practices—even when they are LGBTQ-inclusive—or even places—even when they are queer-friendly—are catalysts for, or homes to, either normative or restorative literacies. Even a normative practice can be reworked to be restorative, but so too can a restorative one fall prey to normativity. It is in the multiple, variable, and fluid nature of literacy practices that there is both danger and promise. These practices, normative and restorative, provide sites of inquiry where we may reimagine literacy teaching and participation in order to disrupt fixed notions of the personal and the public and what of that “belongs” in the classroom.

Consequences of queering

Pritchard (2017) and Waite (2017) foreground the queer in their studies of literacy in general and writing in particular, respectively. Moreover, the queer undergirds the studies of Blackburn, Cruz, Johnson, Schey, and Wargo. We see evidence of this in the multiplicity, variability, and fluidity of literacies and identities as well as the consequences of such intersections. We see it in the disruptions of norms, whether they are norms of literacies or identities. In some cases, the disruptions of literacy and identity happened

simultaneously. And if we look more closely, we see resistance to cisheteronormativity in the students' critical, reflective, and embodied engagements with literacies.

Ava wrote about wanting to dance in the halls (Johnson, 2017), and then, inspired by the band practicing in a nearby room, he embodied this desire. He

offered a couple of eight-count majorette-style dance moves where he flung his arms and rolled his head and neck just like the school's [dancers]. ... He ended with a move that landed him on the floor, one leg bent at the knee, the other straight out and the rest of his body flat on the floor.

Johnson (2020, p. 643).

Those in the afterschool club with him smiled and cheered, and Ava sat down and "wrote in his journal quietly" (p. 643). Ava's resistance, through his dancing and writing, interrupts institution-sanctioned bodies of knowledge meant to "codify and compartmentalize what we know from what we do, from what we are, from the lived experience of our bodies" (Waite, 2017, p. 18). Instead, Ava used movement and writing to embody and reflect on his identity with/in a literacy community that supported his identity-making.

Imani, in the example above, not only assumed the role of a white transphobic lawmaker, as she was assigned to for her class's debate about HB2 (Schey, 2020). She parodied him. She mocked him. She made it perfectly obvious that the view he held offended her. They were, in her view, absurd. And she conveyed all of this to her large class without breaking character. Imani used her body to teach and assumed an intelligibility that, according to Waite, "is to be seen through the lens of what already is, or what already appears to be" (p. 35). In other words, she uses her body and being as a way to critique the absurdity of policies used to disenfranchise trans and other historically marginalized people.

Katrina selected and read aloud the role of the "fairy godfather," in the literacy group at the youth center, and her performance was a delight (Blackburn, 2005). But after the performance, when the group discussed the story, Katrina revealed the ways she had embodied homophobia to protect herself, which was, we imagine, a painful revelation, but she did it to help Trey understand why someone was doing this to him, just as Butch had done in the story. Her painful revelation provoked by the story was a gift to Trey. Her reflection made real the consequences of not just homophobia, but the ways that it affects an entire community.

By looking closely at youth engaged in literacy practices, we see how the spaces—in and out of classrooms, online and face-to-face—are improved by queering. We see how the queered writing of these young people is of particular significance as they explored and asserted their identities. We see how the literacies, themselves, are strengthened when queered. But, more importantly, we see how this queering benefits Ava, Katrina, and Imani. We see how this queering restores them.

Sites of promise: implications for teachers and students

Teachers can be a part of making such restoration possible, for Black queer youth, for queer youth of color, but also for all of their students. We believe that normative literacies are damaging to all who are required to limit themselves to them. While they might be more damaging for some people than others, and more damaging in some situations than others, they are damaging. In contrast, restorative literacies have healing potential for all of those who engage with them. To be clear, we do not believe that there are a clear set of literacies that are "normative" and therefore "bad" and another set that are "restorative" and therefore "good." If queer theory has taught us anything, it is that dichotomies fail us. Instead, there are literacies; likely any of them have the potential for danger, the potential for promise. Different literacies will be engaged with and even embodied differently by different people. As teachers, we are responsible for knowing our students and for knowing which literacy practices and events have the potential for promise, the potential of restoration for our students, for all of our students, including but not limited to our Black, queer students.

Literacy educators who strive to make their classrooms and schools queer by engaging their students in literacy practices and events that are restorative can get guidance from the scholars who worked with Imani, Nilah, Justine, and Zeke, among others. Educators must reflect on their own biases (Blackburn, 2005), not only against LGBTQ people but also people of color. They must own these biases and then work every moment to disown them. Kendi (2019) describes antiracism as relying on a rejection of other forms of oppression, such as homophobia and transphobia. Further, he describes antiracism as a sticker rather than a tattoo; that is to say, that it is something that we must claim for ourselves and work to make happen every moment of every day; it is not something that we accomplish and then check off of our list. Likewise, taking an antinormative stance requires that teachers rely on a rejection of discourses of standardization that relegate Black and Brown students to the margins of educational opportunity. Educators must understand that even though they are doing antiracist and antinormative work, not everyone is. Because of that reality, they must work tirelessly to ensure that the queer youth of color in their classrooms and schools are protected from the curriculum, disciplinary, and actual violence that often accompanies racism, homophobia, and transphobia. Of course, it is not enough to protect students from violence, but it is imperative.

In such a context, literacy educators can engage students in "writing that connects the self and the world," which Johnson (2017) describes as including language "to question the social construction of the self and challenge the status quo in an effort to discover alternative paths for self- and social development" (p. 30). In this way, Johnson asserts, literacy teachers can "invite students to compose themselves in ways that enact their queer identities" (p. 30). Educators might also take the initiative to "design literacy

learning opportunities that explicitly center queer-inclusive curricular content" (Schey, 2020, p. 35). By doing this, teachers take on the responsibility of having chosen to include queer content as well as queer forms (Waite, 2017) which relieves students of the potential homophobic and transphobic consequences for having made such choices themselves.

Beyond this, literacy educators must prepare queer students of color "to interrogate perspectives, produce countertexts, and imagine a more just world" (Johnson, 2017, p. 30). In short, they must prepare their students to use literacies for anti-racist and queer activism. Johnson (2017) challenges literacy educators to encourage students "to write the self ... in ways that allow them to recognize and fight injustice" (Johnson, 2017, p. 30) and to "provide literacy practice aimed at empowering [students] to use their voices against racism, homophobia, and injustices while learning to be in a world where these are realities" (Johnson, 2017, p. 30). Wargo (2017b) encourages literacy teachers to pay attention to the ways "historically marginalized youth ... use an array of communicative resources to remix, remediate and redistribute stories of inequity" (p. 158). Schey (2020), however, notes that sometimes when queer students of color engage in activism in their classrooms, others push back against them, resulting in conflict. Sometimes, teachers are so uncomfortable with this conflict that they terminate the discussion, which essentially terminates the activist effort. Furthermore, Schey suggests that educators

reflect on how they respond when conflict arises in the classroom, especially around topics of sexual and gender diversity. ... attempt to understand what motivates their pedagogical decisions and how these decisions affect youth. ... [Do they] reify oppressive values and practices ... or ... invite people to resist, contest, and even transform them (p. 34).

Moreover, Schey (2020) asks that teachers "attempt to stick with conflict—even though it is often incredibly uncomfortable—when it arises around contentious topics such as queerness" and to "consider whose comfort and safety is maintained when conflict is regularly shut down" (p. 35). Together, these scholars challenge educators to prepare students to assert themselves, but also let them do it, in their classrooms, even when it makes them uncomfortable.

We argue that restorative literacies, which are, at the core, anti-racist and queer, benefit all students—certainly queer students of color, but not solely queer students of color. We argue that all students benefit from being protected against violence, even violators, who are made lesser as they embrace violent ideals and commit violent acts. All students benefit from teacher support to write, read, and use language in ways that permit students to come to know more about themselves in relation to the world around and beyond them. This is an advantage that many students have already and one that queer students of color are owed. All students benefit, too, from being prepared to assert themselves and to undo oppressions, whether they are oppressors or oppressed; either way, their dignity suffers in a context where oppression reigns. Enacting practices and pedagogies grounded in restorative literacy requires a commitment to improving the lives of Black, queer students, but also obliges belief that in their value even more broadly speaking, not only because we could all benefit from self-definition, self-care, and self-determination, but also because we all benefit from being a part of a community where everyone is free.

Understanding the roots of literacy in the United States

Ancient civilizations of African, Asian, Indigenous, and Latinx people who inhabited the Americas before European settler-colonialists arrived had developed literate histories and educational systems, including colleges and universities (or equivalents), centuries before the Common Era. As well, each society possessed literacies used by its members to communicate with one another. Nearly half of Africans brought to the United States came from Senegambia (Senegal, Gambia, Guinea-Bissau, and Mali) and West-central Africa (Angola, Congo, Democratic Republic of Congo, and Gabon). These regions in Africa established universities, such as the University of Timbuktu, Mali, (982 CE). China also established imperial colleges during the Western Han dynasty (206 BC–9 AD), and Mayans established colleges in Mexico, College of Santa Cruz de Tlatelolco (1536). These societies were literate and richly cultured, intellectual, sophisticated, and complete. The idea that only Europeans were civilized, and they alone possessed literacy, is a false narrative created to obfuscate cultural, educational, linguistic, and literary histories of Black, Indigenous, and People of Color (BIPOC). The false narrative was developed to depict non-White ancient civilizations as primitive, their people as less-than-human, and to justify European settler-colonialism's castration, terrorism, theft, rape, slaughter, and violence perpetrated against BIPOC. The false narrative also is used to deflect from the ideological and legal barriers to literacy access created by settler-colonialists and generations of dominant power elites that followed.

In this historical moment, the US is repudiating the false narrative and revealing the original American sin of racism and exposing the Big Lie: in the US all people are created equal, citizens receive due process, and have equal rights and privileges under the law. We have a moral responsibility to reveal and correct the past as we move forward. This chapter is premised on the fundamental idea that literacy is a human right, meaning that literacy is necessary to function in society. I interrogate literacy history and use counter-narratives of BIPOC to examine the intersection of access to literacy, laws, and racism. The result is a case study of how systemic institutional and structural racism pre-empt the literacy progress of BIPOC.

The text is framed as a critique, in the Foucauldian (1988) sense, where "a critique is not a matter of saying that things are not right as they are. It is a matter of pointing out on what kinds of assumptions, what kinds of familiar, unchallenged, unconsidered modes of thought the practices we accept rest" (p. 154, cited in Gore and Morrison, 2001, p. 568). I identify an ideology of White supremacy as underpinning the systematic denial of literacy access. Ansley (1997) remarks that White supremacy, represents

a political, economic, and cultural system in which whites overwhelmingly control power and material resources, conscious and unconscious ideas of white superiority and entitlement are widespread, and relations of white dominance and non-white subordination are daily reenacted across a broad array of institutions and social settings. (p. 592)

I extend his description to the legal system by examining the intersection of laws, literacy, and racism "to better understand how race functioned [and functions] in conjunction with educational policy" (Child and Klopotek, 2014, p. 6), and how White supremacy is "reconstitutive" (Crenshaw, 2020). Central to this examination is exposing White supremacy within law, literacy, and society. The text hovers over the early years of nation-building to demonstrate attempts to codify, justify, legalize, normalize, and politicize White supremacy. To anchor such a huge undertaking, I draw on US Supreme Court law as a guidepost and BIPOC narratives as counter-hegemonic responses. Briefly reviewed, are three landmark Supreme Court cases (*Dred Scott v Sanford*, *Plessy v Ferguson*, *Brown v Board*) as they represent laws and legal decisions established by the country's penultimate court. They also expose

how “racism was supported by the rule of law and perpetrated by constitutional mandate” (Browne-Marshall, 2013, p. xx). Further, I include a review of selective state and local laws that address race to provide context about racial inequality and its effects on the lives of individuals, families, and communities.

A single chapter cannot adequately represent centuries of sociohistorical contexts, laws, literacy, and racism; thus this chapter provides a limited and selected review. The chapter sections include early U. S. history (laws, literacy, and racism), followed by like-minded discussions in the 20th and 21st centuries. I situate events within narratives about the lived experiences of BIPOC, in which “situatedness posits that the activity of the mind (in all its cognitive, emotional, perceptual, and social capacities) is the causal product of bodily, social, environmental, and cultural interactions and that these factors serve as both the implicit causal backdrop and ontological basis for the mind” (Costello, 2014, p. 1757).

Thus, situatedness helps to reveal the human toll of White supremacy expressed in BIPOC counter-narratives and disentangles how barriers to literacy were supported by federal, state, or local laws. BIPOC counter-narratives unveil how literacy was conceptualized, framed, and practiced. Ideally, in a chapter that addresses race, all races would be equally and sufficiently covered; however, space limitations prevent a thorough retelling.

African, Indigenous, and Spanish literacies

When European settler-colonists arrived on the shores of the “new world,” millions of Indigenous people called the land home. Dunbar-Ortiz (2014) emphasizes the goal of European settler colonialism was “a genocidal policy ... to terminate their existence as peoples—not as random individuals” (p. 6). Castillo (2015) also details how Catholic priests, under the auspices of the Spanish government, took possession of Indigenous lands in the West, enslaved Indigenous people, and forbade teaching Indigenous people literacy. McCarty and Lee (2014) note that Indigenous people historically have been considered sovereign tribal nations, and acknowledge “tribal sovereignty is inherent, predating the US Constitution, but is also recognized within the Constitution and in treaties and case law. The cornerstone of the tribal-federal relationship is a legally and morally codified relationship of *trust responsibility* that is both voluntary and contractual” (p. 102, emphasis in the original).

Irrespective of the Constitutional (1787) mandate, Congress sanctioned a Civilization Plan (1789) to acquire Indigenous lands, use missionaries to convert Indigenous nations to Christianity, and teach English to Indigenous people. By 1819, the Choctaw nation avowed its interest and commitment to education, established and maintained schools, and taught students to read and write in their native language as well as English (Spring, 1996, p. 14). The Cherokee people also understood the value of education and literacy.

Sequoyah (1760–1843), a full-blood Cherokee, invented the Cherokee syllabary, that “empowered those who spoke the language to read and write” (Parins, 2013, p. xiv). Many Cherokee people learned to read and write: “in a matter of weeks, large numbers of the population became literate in their native language” (p. xiv). The rapid literacy acquisition by 1826, was based on the use of Cherokee symbols, unlike attempts to replicate the Cherokee language using the English (Roman) alphabet. The Cherokee syllabary, “consisted of 86 characters, each of which represented a Cherokee syllable. Speakers ... could memorize the characters, and within days they could read anything written using the syllabary” (Parins, 2013, p. 32). The Cherokee nation published their first newspaper the *Cherokee Phoenix* in 1828, in Cherokee and English, among Cherokee living in New Echota. Parins (2013) notes the Cherokee syllabary “became a gateway to a world of intellectual possibilities and had profound effects on the political, social, economic, and educational affairs of the Cherokee Nation that continue to this day” (p. xiv). It created an opportunity for communication among the Cherokee and helped “to preserve their culture and heritage, and to prove to the world that their society was viable and distinct” (Parins, 2013, p. xvi). Many Cherokee people also were able to read and write in English. (My paternal grandmother was a full-blood Cherokee of the Echota tribe.) The settler-colonialists and missionaries mounted a campaign to delegitimize the Cherokee syllabary, in support of the English alphabet. Given that literate Cherokee people were not dependent on White settler-colonialists to communicate, govern, or transact business, White settler-colonialist experienced a loss of power and control. It should also be noted that while the Chickasaw and Cherokee nations developed literacy, other Indigenous nations believed the “word” was sacred, “present,” and should not be written or preserved in written form.

The Indian Removal Act (1830) also was passed during this period as it forced the migration of five nations of Indigenous people (Cherokee, Chickasaw, Choctaw, Creek, and Seminole) from their fertile farmland in the Southeast to land west of the Mississippi. When the Indigenous peoples arrived, they were confronted by White colonizers who did not accept them as equally human and ignored the Constitutional mandate: “to protect or enhance tribal assets (including fiscal, natural, human, and cultural resources) through policy decisions and management actions” (Wilkins & Lomawaima quoted in McCarty & Lee, p. 102). Indigenous people were not alone in their quest for freedom or education, nor were they alone in their quest to acquire literacy.

African people were first brought to North America, now Florida in 1565, by a Spanish conquistador. The false narrative, however, begins with the arrival of African people in Virginia (1619), in large part because it creates a connection to Northern Europe. Initially, African people were brought as indentured servants, people who could work a determined number of years and purchase their freedom. In less than 50 years, however, their status changed when Slave Codes were created to restrict the lives of enslaved African people: “stripped of their names, religions, identities, nationalities, and legal status as human beings” (Browne-Marshall, 2013, p. 3). The Slave Codes justified, and legalized White supremacy as enslaved Africans were not considered people but the property of their owners, and chattel slavery had no end.

Codifying anti-literacy through US courts

As the fledgling nation struggled to enact a democracy, a deal was struck during the Constitutional Convention (1787), between the Northern and Southern states for representation in the House of Representatives. State representatives would be determined by counting enslaved Black people as three-fifths of a (White) person (Three-Fifth's Compromise). The lives of enslaved Black people were regulated and surveilled by White people, they were not permitted to assemble (unless a White person was present), own fire-arms, testify in a court of law, or leave the premises of a White person without permission. They also were not permitted to: marry, own property, learn (or teach someone) to read or write, nor read literature that might excite them and encourage rebellion. Black people, however, sought an education—as [Anderson \(1988\)](#) argues “the denial of opportunities for schooling has translated into the denial of access to literacy” (pp. 35–36).

Most of the Southern states established laws prohibiting enslaved Black people from learning to read, and from teaching others to read. In 1818, North Carolina's General Assembly (1818), enacted an anti-literacy law, later revised and entitled “A Bill to Prevent All Persons from Teaching Slaves to Read or Write, the Use of Figures Excepted” (1830):

Whereas the teaching of slaves to read and write, has a tendency to excite dissatisfaction in their minds, and to produce insurrection and rebellion, to the manifest injury of the citizens of this State:

... any free person, who shall hereafter teach, or attempt to teach, any slave within the State to read or write, the use of figures excepted, or shall give or sell to such slave or slaves any books or pamphlets, shall be liable to indictment ...

... That if any slave shall hereafter teach, or attempt to teach, any other slave to read or write, the use of figures excepted, he or she may be carried before any justice of the peace

n.p., [Legislative Papers \(1830–31 Session of the General Assembly\)](#).

To further discourage access to literacy, enslaved Black people were described as subhuman and “uneducable.”

Black and White people broke laws and taught Black people to read and write. Harriet Ann Jacobs (1813–1897) who was born as an enslaved person in Edenton, North Carolina, learned to read and write when she was taught by her first White mistress. In her narrative, *Incidents in the life of a slave girl: Written by herself* (1861), Jacobs acknowledged that she also taught enslaved Black people to read and write. In a touching example, she described teaching an elderly enslaved man, Uncle Fred:

I asked him if he didn't know it was contrary to law; and that slaves were whipped and imprisoned for teaching each other to read. This brought the tears into his eyes. “Don't be troubled uncle Fred,” said I. “I have no thoughts of refusing to teach you. I only told you of the law, that you might know the danger, and be on your guard.” ... I selected a quiet nook, where no intruder was likely to penetrate, and there I taught him his A, B, and C. Considering his age, his progress was astonishing (p. 112).

With the support of White abolitionist, Lydia M. Child, Jacobs published her narrative that includes a description of the horrors of slavery, a strong pronouncement of Christianity, and fervent support of the importance and value of literacy. In some Northern communities, however, Black children attended schools and learned to read and write.

After the Massachusetts Supreme Court (1783) case, the *Commonwealth v. Jennison* abolished slavery, Black school children in Boston, Massachusetts, were permitted to attend public schools with White children. However, this was often fraught as Black children faced racial harassment and “physical and emotional discrimination that led to the creation in 1798 of the Smith School, a private school for Blacks” ([Browne-Marshall, 2013](#), p. 20). Benjamin F. Roberts brought a lawsuit against the City of Boston's School Committee on behalf of his young daughter, Sarah, *Roberts v Boston* (1850), so she could attend the White school close to their home. The presiding Chief Justice in the case, Lemuel Shaw, ruled in favor of the Boston School Committee noting how people perceive racial differences “is not created by law, and probably cannot be changed by law” ([Massachusetts Historical Society, n.p.](#)). [Browne-Marshall \(2013\)](#) maintains the Roberts' lawsuit “would form the cornerstone of future court decisions legally segregating children in public schools” (p. 21). This judicial decision also normalized anti-Black racism, anti-literacy, and unequal access to education.

Anti-black racism and white supremacy

The Supreme Court codified, justified, legalized, and normalized White supremacy as well as anti-Black racism in the *Dred Scott v Sandford* (1856) case. Mr. Scott argued that he was a citizen of the US, and therefore the rights and privileges of citizenship adhere.

Chief Justice Taney provided a (White) commonsensical understanding to an interpretation of the [Declaration of Independence \(1776\)](#) and the US Constitution, by first posing a question, then supplying a response:

Can a negro, whose ancestors were imported into this country, and sold as slaves, become a member of the political community formed and brought into existence by the Constitution of the United States, and as such become entitled to all the rights, and privileges, and immunities, guaranteed by that instrument to the citizen?

Moreover, the Court's majority opined deeply-held beliefs about the superiority of White people and the inhumanity of Black people:

The words "people of the United States and "citizens" are synonymous terms, and mean the same thing

... they [Black people] were at that time considered as a subordinate and inferior class of beings, who had been subjugated by the dominant race, and, whether emancipated or not, yet remained subject to their authority, and had no rights or privileges but such as those who held the power and the Government might choose to grant them

They had for more than a century before been regarded as beings of an inferior order, and altogether unfit to associate with the white race, either in social or political relations; and so far inferior, that they had no rights which the white man was bound to respect; and that the negro might justly and lawfully be reduced to slavery This opinion was at that time fixed and universal in the civilized portion of the white race. It was regarded as an axiom in morals as well as in politics, which no one thought of disputing, or supposed to be open to dispute; and men in every grade and position in society daily and habitually acted upon it in their private pursuits, as well as in matters of public concern, without doubting for a moment the correctness of this opinion

... in the eyes and thoughts of the men who framed the Declaration of Independence and established the State Constitutions and Governments ... that a perpetual and impassable barrier was intended to be erected between the white race and the one which they had reduced to slavery, and governed as subjects with absolute and despotic power, and which they then looked upon as so far below them in the scale of created beings,

They perfectly understood the meaning of the language they used, and how it would be understood by others; and they knew that it would not in any part of the civilized world be supposed to embrace the negro race, which, by common consent, had been excluded from civilized Governments and the family of nations, and doomed to slavery.

Given Taney's explanation of commonly understood discourse among White people in his opinion, permitted The *Dred Scott* decision to codify and justify the ideology of White supremacy as a widely accepted belief. Importantly, it also attempted to legalize and federalize White supremacy using the Supreme Court.

Legally, the overt White supremacy expressed in the *Dred Scott* law was overturned after the Civil War (1861–1865), by a series of laws: Civil Rights Law (1866), and the Civil War Amendments ([Const. amend. XIII](#), abolished slavery; [Const. amend. XIV](#), defined equal rights, due process, & citizenship; and [Const. amend. XV](#) extended voting rights to Black men). Among the changes were greater access to literacy, confirming Black people's belief that access was a key component to freedom and liberation. During Reconstruction, several agencies worked at the federal and state level to extend literacy access: the American Missionary Association (AMA) and the Bureau of Refugees, Freedmen, and Abandoned Lands (Freedmen's Bureau). The latter was established by Congress under the Freedmen's Bureau Acts (1865–1866), and initially designed to address the needs of newly freed Black people. The agencies shared a focus on literacy, "to meet their [Black people's] economic, educational, political, and social obligations and construct a barrier to further exploitation" ([Cabral, 2006](#), p. 13). Wishing to please Southerners, Congress at the insistence of President Andrew Jackson, included the needs of White people in these acts. Their decision began a pattern within the federal government to only make a provision for Black people if White people also were (are) accommodated.

There also were immeasurable numbers of Black and White teachers and volunteers who sought to improve literacy access following the Civil War. Among those were Black women, some of whom had normal school and college teacher training, and others who were less well-educated but dedicated to providing literacy access to Black people and racial uplift. The notion of racial uplift encompassed the "value and significance of literacy education as a necessary first step toward full freedom ... learning to read and write as well as other aspects of self-improvement and self-sufficiency were eventually categorized under the heading of uplift" ([Cabral, 2006](#), p. xi). BIPOC understood literacy was not limited to the ability to read and write or communicate, they had read the world around them to survive; literacy was a matter of individual and collective freedom and liberation. Acquiring literacy would lead to increased knowledge and Black people believed that literacy was "the most significant weapon to ward off deliberate, calculated, and dehumanizing confrontations with the White power structure and members of the local White community who attempted to take advantage of the Blacks' lack of basic literacy skills" ([Cabral, 2006](#), p. 14). Administrators from the AMA and Freedmen's Bureau, as well as teachers, periodically published field reports that stressed Christian faith, agency progress, students' progress, and the importance of literacy.

Many of the Black women teachers were often activists and aware of the horrors of slavery as well as the destitute conditions under which formerly enslaved Black people lived. Black women activist teachers understood the importance that Black parents placed on having their children acquire literacy. Charlotte “Lottie” Bridges Forten Grimké (1837–1914) exemplified this group of Black women teachers. She was born into a free, financially secure, and respected abolitionist Black family in Philadelphia, Pennsylvania. Moreover, she was educated by private tutors before attending Higginson Grammar School. She was the only Black student at Salem Normal School, and later taught at Higginson. Charlotte was committed to racial uplift and advancing education for Black people and, as a well-published author, she often wrote about racial injustice. While teaching on St. Helena Island, South Carolina, she published a two-part article about her experiences in *The Atlantic Monthly*.

After the lessons, we used to talk freely to the children, often giving them slight sketches of some of the great and good men. ... Miss T. told them the story of the brave old man who had died for them. I told them about Toussaint, thinking it well they should know what one of their own color had done for his race. They listened attentively, and seemed to understand (Forten, 1864, n.p.).

Grimké emphasized the eagerness of Black people in the community to acquire an education. A similar sentiment was expressed by Alvord (1980), a Freedmen Bureau supervisor

Throughout the entire South an effort is being made by the colored people to educate themselves. In the absence of other teaching they are determined to be self-taught; and everywhere some elementary text-book, or fragment of it, may be seen in the hands of negroes. They quickly communicate to each other what they already know, so that with very little learning many make take to teaching.

Quoted in Brosnan (p. 235).

Johnson (1991) also mentions that during Reconstruction, Black people often preferred schools established by other Black people as they were “distrustful of whites, while whites were disdainful of black teachers and dismayed at the popularity of black-controlled schools among black families who preferred them to the white-managed counterparts, even when the latter were free and the former charged tuition” (p. 90). Legally, the ratification of the Civil War Amendments (13, 14, 15, 16) extended to all citizens the rights and privileges guaranteed in the Constitution (sans voting rights for women). The right to equal education was an important opportunity as Black people understood: “literacy was fundamental to their survival in post-war society, southern black men and women energetically campaigned for a system of education” (Brosnan, 2019, p. 238). Black people, with few resources and often with the support of sympathetic White people, managed to create Black academies, colleges, industrial training schools, normal schools, and universities.

Civil War Amendments and equal rights

The 13th Amendment (1865) included the “exception clause” that stated: “Neither slavery nor involuntary servitude, except as a punishment for crime whereof the party shall have been duly convicted, shall exist within the United States, or any place subject to their jurisdiction” (n.p.). Given that many locales did not permit Black people to participate in courts of law, i.e., *Ohio History Central* (1807) did not permit Black people to testify against a White person, the clause was used to unjustly incarcerate Black people who became a free source of labor for well-connected White people. Despite the passage of Civil Rights Laws many White Southerners also continued to embrace White supremacy and ignored the laws. They created the notion of “states rights,” also known as “a states right to continue slavery,” to circumvent the law. For example, they established Black Codes and Jim/Jane Crow laws to reinstate aspects of slavery: economic dependency, disenfranchisement, mass incarceration, racial discrimination, and segregation. Although the 15th Amendment (1870) prohibited the federal government and each state from denying a citizen the right to vote based on that citizen’s “race, color, or previous condition of servitude,” disenfranchisement was rampant.

Asian Americans also endured unjust treatment at the hands of White settler-colonialists. Asian Americans and American Pacific Islander (AAPI) were the focus of several laws, for example the *National Archives* (2021) noted: “the Chinese Exclusion Act of 1882, ...was the first significant law restricting immigration to be passed by the US Congress (cited in Kim and Hsieh, LRA Statement against Anti-Asian Violence 2021). Through years of anti-Chinese discrimination, this law increased tensions for new immigrants” (Kim and Hsieh, 2021, para 3). Anti-Asian racism erupted in 1886, as White vigilantes sought to deport hundreds of people of Chinese descent. Some people were killed, others deported, and still others sought legal redress. Although there was a trial, no one was held accountable. Anti-Asian violence continued and was supported by federal law in “the Immigration Act (1917),” a law that barred all immigrants from the “Asiatic zone.” The act also is known as the “Literacy Act” – as it required immigrants to pass an English language literacy test for entrance into the US (Kim and Hsieh, 2021).

During this period, the federal government established and withdrew treaties supported by the Dawes (1888) and Curtis (1898) Acts as Indigenous nations were removed from their land. Missionaries from various religious denominations sought to convert the Indigenous people to Christianity and to teach them English in missionary and boarding schools. Indigenous children were forcibly removed from their families, and communities, prohibited from using cultural ways of knowing and home languages, and forced to assimilate to White American ways (Biava, 1990). In boarding schools an “... ‘appropriate’ education was... that which eradicated Indianness or promoted Anglo values and ways of communicating” (Brayboy, 2005, p. 437). Pratt, who created an Indian boarding school, stated, “the only good Indian is a dead one ... I agree with the sentiment, but only in this: that all the Indian there is in the race should be dead. Kill the Indian in him, and save the man” (quoted in Browne-Marshall, 2013, p. 47). Indigenous children were

required to disassociate themselves from their language and heritage and learn the attitudes, beliefs, behaviors, languages, and values of White settler-colonialists.

The federal government was slow to grant citizenship status to Indigenous people and people of Mexican descent. After signing The Treaty of Guadalupe Hidalgo (1848) that ceded present-day Arizona, New Mexico, and Texas, as well as parts of California, Colorado, Nevada and Utah, the US government failed to uphold agreements (Article VIII and Article IX) whereby landowning people of Mexican descent retained their land. When the Mexican economy became depressed there was a massive migration (1872–1910), as Mexican people migrated to the United States. Gallegos (1992) mentions that Mexican people possessed a literate society before they were forced to learn English literacy in the US, as Mexican communities established schools and taught literacy skills in Spanish.

Another landmark Supreme Court case, *Plessy v Ferguson* (1896), occurred less than 50 years after Dred Scott. The case began with the *Louisiana Separate Car Act* (1890) which required Black people to sit in separate cars from White people. Homer Plessy believed he was legally permitted to sit in the White section because he claimed that he was 7/8s White. In a landmark Supreme Court decision, the Court ruled that racial segregation was constitutionally legal, under the “separate but equal” doctrine. Speaking for the majority, Justice Brown argued, “a statute which implies merely a legal distinction between the white and colored races has no tendency to destroy the legal equality of the two races, or reestablish a state of involuntary servitude” (p. 543). He added that the 14th Amendment was not written “to enforce the absolute equality of the two races before the law,” because the amendment “could not have been intended to abolish distinction based upon color, or to enforce social, as distinguished from political, equality, or a commingling of the two races upon terms unsatisfactory to either” (p. 544). Drawing on the *Robert’s* case, the Court’s majority ruled:

[The] establishment of separate schools for white and colored children... has been [deemed] a valid exercise of the legislative power even by courts of States where the political rights of the colored race have been longest and most earnestly enforced (p. 544).

Justice John Harland lodged the lone dissent:

The white race deems itself to be the dominant race in this country. And so it [is], in prestige, in achievements, in education, in wealth, and in power. So, I doubt not, it will continue to be for all time, if it remains true to its great heritage, and holds fast to the principles of constitutional liberty. But in view of the constitution, in the eye of the law, there is in this country no superior, dominant, ruling class of citizens (p. 559).

The case launched a political, judicial, societal, and racial juggernaut: a federal law that codified and legalized racial inequality to exploit BIPOC and privilege White people, or as Prendergast (2002) remarked, the decision to legalize segregation highlighted “the country’s most visible symbol of White supremacy” (p. 210). The doctrine of “separate but equal,” and the Jim/Jane Crow laws legalized under it, were contrary the US Constitution’s declarations of equal protection, due process, and the rights of citizenship under the Constitution.

Systemic racism in politics and education

The 19th century Supreme Court rulings and racially exclusionary laws extended into the 20th century when people of Asian and Pacific Islander descent entered the US, through Hawaii, and Angel Island, California. Their children, like BIPOC before them, were required to attend segregated schools and learn ‘American’ attitudes, beliefs, culture, language, and values. In this manner, literacy access was disproportionately based on economics, ethnicity, geography, language, and race. Irrespective of a person’s access, literacy was assessed and measured as if all people had the same access.

White supremacy reconstituted and extended itself in educational testing by embracing eugenics, or the inheritability of traits, herein intelligence. Galton (1883) defined *eugenics* as, “the study of the agencies under social control that seek to improve or impair the racial qualities of future generations either physically or mentally” (n.p). His belief that Nordic European people represented the apex of intellect, and African people the base, gave rise to scientific racism, the notion that race is biological. Scientific racism is “a deliberate attempt to justify and protect systems that allows exploitation ... to reap economic and political rewards” (Thompson, quoted in Paludi and Haley, 2014, p. 1697). Educational experts used scientific racism to conduct early literacy studies based on the culture and language of ‘native born’ White Americans to the exclusion of all other ethnic/linguistic/racial groups, then, assessed all students by Eurocentric standards. The application of scientific racism in educational testing demystifies how “an ever-changing European-American Protestant standard [that] is the unachievable goal placed on people of color and poor Whites ... placing people of color beneath Whites in all aspects of life” (Browne-Marshall, 2013, p. 5). Thus, allowing educational researchers to conclude that the performance of BIPOC on standardized achievement and intelligence tests was proof of White superior morals and intelligence. Educational psychologists and members of eugenics organizations (Terman, Thorndike, Yerkes) also worked in concert with the federal government during World War I, to develop tests for Army recruits largely, but not exclusively, based on “verbal skills” or literacy. Not surprisingly, BIPOC—who for over two centuries had been denied access to literacy—did not perform

as well as their White peers. The poor performance of BIPOC was celebrated as scientific “proof” of the intellectual superiority of White people. These early studies concealed White supremacy within literacy theorizing and testing by claiming to be culturally-neutral, objective, and scientific measures.

Codifying racism

The judicial ruling of *Plessy v. Ferguson*, “separate but equal education,” resurfaced in three Supreme Court cases. First, *Gong Lum v. Rice* (1927) ruled a Chinese American girl was not White, and thus could not attend a White school. Similarly, students of Mexican descent were not part of the California Education Code that required segregated schools for students of Black, Asian (Chinese, Japanese, or Mongolian), and Indigenous descent. Second, students of Mexican-descent won the right to an equal education in *Mendez v. Westminster* (1947). The U. S. Supreme Court stated that Mexican Americans and “all other groups” have equal protection under the 14th Amendment. Third, the landmark case of *Brown v. Board of Education of Topeka, Kansas* (1954, 1955). The Brown case was part of a class-action lawsuit brought by aggrieved parents on behalf of their Black children who were forced to attend segregated schools. Mr. and Mrs. Brown believed their daughter, Linda a first-grader, should not walk past a White school, and through a series of railroad crossings to attend a Black school. The psychological trauma inflicted on Black children who attended segregated schools appeared to be a key component of the Brown case (Browne-Marshall, 2013). The justices argued that education:

is a principal instrument and awakening the child to cultural values, preparing him for later professional training, and in helping him adjust normally ... it is doubtful that any child may reasonably be expected to succeed in life if he is denied the opportunity of an education. Such an opportunity, where the state has undertaken to provide it, is it right which must be made available for all on equal terms.

Brown (1954, p. 493).

The US Supreme Court unanimously passed Brown, ruling a violation of the equal protection clause of the 14th Amendment, thus dismantling the doctrine of “separate but equal.” Chief Justice Warren declared, “In the field of public education, the doctrine of ‘separate but equal’ has no place. Separate facilities are inherently unequal” (*Brown v. Board of Education I*, 1954, p. 495). *Brown II* (1955) maintained that the Court’s notion of “all deliberate speed” – was permitted compliance on terms set by local school boards.

While many Black people sought integration of public schools, some leaders like Martin Luther King, Jr., did not. He argued, “white people view black people as inferior ... People with such a low view of the black race cannot be given free rein and put in charge of the intellectual care and development of our boys and girls” (quoted in Kendi, 2019, p. 173). At the state and local level, school boards did not rush to comply with the law, trying various ways to subvert the federal order by removing White students from public schools, or moving to all-White suburbs to avoid integration. The implementation of *Brown* hinged not only on federal law but on the willingness of state and local officials to enforce the law. Drawing on White supremacy and admonitions of “states” rights, the process to end racial discrimination in public education was undermined.

President Lyndon B. Johnson (1963–1969) reign

A decade later, the 14th Amendment and the *Civil Rights Act* (1964) effectively struck down Jim/Jane Crow laws and legally ensured human and civil rights were extended to all US citizens. The Civil Rights Act of 1964 (Sec. 601; 78 Stat. 252; 42 U.S.C. 2000d) was part of a multipronged federal socioeconomic plan implemented by President Lyndon B. Johnson. His strategy sought to link political and social reform efforts to civil rights legislation and enforcement, as well as to educational reform and funding. Under this plan, the 1965 *Elementary and Secondary Education Act* (ESEA) was designed to work in concert with the Civil Rights Act to address racial and social inequality: “Congress would not have taken this step [passing ESEA] had Title VI [of the Civil Rights Act] not established the principle that schools receiving federal assistance must meet uniform national standards for desegregation” (*US v. Jefferson Co. Bd. Of Ed.*, 372, E. 836, fifth Cir. 1966, as cited in Frankenberg and Taylor, 2015). ESEA provided financial support to address economic, racial, and social discrimination as well as political avenues for educational access and opportunity, specifically for BIPOC students, students living in poverty, and students with disabilities (ESEA, Sec. 201). In addition, under Johnson’s plan voting rights—that had been restrained, suppressed, and violated in many states—needed to be extended to all people. Voter suppression took on many forms and one tactic used to disenfranchise Black people were literacy tests. Although the period of Reconstruction had improved access to literacy for Black people; Jim/Jane Crow laws were established to retard and slow down equal access to education. Through the efforts of individuals and institutions, some Black people were taught to read and write. Septima Poinsette Clark (1898–1987), for example, was a civil rights advocate, member of the NAACP, and teacher who worked with Myles Horton of Highlander Folk School. They created Citizenship Schools to teach Black adults literacy and to register to vote in South Carolina. Bernice Robinson, Septima’s cousin, secretly taught Black people to pass the “literacy test.” They believed that teaching literacy

should not try to isolate people’s learning of reading, writing, and critical thinking from the community in which they reside; the historical roots from which they follow; the language they use in defining their existence; and the politics and economics that shape and reshape their critical thinking/reflections of themselves and others.

Peavy (1993, p. 213).

The Citizenship Schools were successful in teaching literacy, but the literacy test required a person to read and explain any portion of the South Carolina state constitution. Local deputy registers could ask any question and the veracity of responses was decided at the register's discretion. The responses of Black people were deemed unacceptable.

In the summer of 1964, Freedom Schools also were organized by a variety of Black community, political, and student groups to improve the quality of education received by Black students in the rural South. A network of over 40 schools, for example, served two thousand Black students in Mississippi from July–August 1964, where improving the literacy skills of students was a major component. Students learned basic grammar, improved reading comprehension, and used writing for expression and protest. The Black and White Freedom School teachers were a mix of classroom teachers, college students, and volunteers... [who] sought to build students' self-esteem, linked cultural understandings to the curriculum, and encouraged students to use their voice to protest racial injustice. Citizenship and Freedom Schools were grassroots efforts as well as political extensions to provide and ensure Black people had access to literacy.

Systemic racism in education

The passage of the 1964 Civil Rights Act, 1965 Voting Rights Act, and the ESEA, helped to usher in the politicization of literacy in education. Congress charged experts to find the best way to teach beginning reading in the First-Grade Reading Studies (Bond and Dykstra, 1967). They requested a review of studies that could address cultural, economic, linguistic, and racial differences among students. The experts solicited studies that applied experimental research methods in the study of beginning reading programs; however, studies that focused on students who were Black, lived in urban or low-income areas, and students who were Spanish dominant, were discarded (Chall, 1967). The final report was positioned as apolitical, color-blind, and objective, although it applied and extended scientific racism through experimental testing to early reading. The study established a pattern that: focused on the learning needs of White students; denigrated BIPOC communities, families, and students; and used federal funding for research to validate White intellectual superiority. It also idealized US students as English dominant, middle-to-upper class, with above-normal abilities, and White (Willis, 2008). An equal education for students of Asian descent was the grounds for the *Lau v Nichols* (1972) case as the rights of children of Chinese ancestry were violated, as outlined in the 1964 Civil Rights Act, when English was used as a language of instruction. The sole use of English for instruction denied students who were not proficient in English an equal opportunity for an education.

In the *Plyler v Doe* (1982) case, a class-action suit on behalf of undocumented children of Mexican descent, the US Supreme Court ruled in favor of the plaintiff's case. They cited the equal protection clause of the 14th Amendment, and acknowledge a person's psychological well-being, and highlighted the importance of literacy. Justice Brennan presented the Court's opinion

illiteracy is an enduring disability. The inability to read and write will handicap the individual deprived of a basic education each and every day of their lives. The inestimable toll of that deprivation on the social, economic, intellectual, and psychological well-being of the individual, and the obstacle it poses to individual achievement, make it most difficult to reconcile the cost or the principle of a status-based denial of basic education with the framework of equality embodied in the Equal Protection Clause.

In addition to new laws, a series of Congressional education reports, *A nation at risk* (1983), *Goals 2000*, and *America 2000*, helped to chart the nation's future educational goals.

Several reports specific to literacy requested by Congress, also were published: *Becoming a Nation of Readers: The Report of the Commission on Reading* (Anderson et al., 1985), *Beginning Reading* (Adams, 1990), *Preventing Reading Difficulties* (Snow et al., 1998), and the *National Reading Panel Report* (2000). The politicization of education spawned new federal agencies, the National Center for Educational Statistics, and the National Assessment of Education Progress (NAEP), among others. With Congressional support, cyclically, NAEP assessed school children's reading (and writing) and produced the *Nation's Reading Report Card*. The results are disaggregated by gender, race, and social class, to reveal reading results for Black, Latinx, and Indigenous students are below Asian, Asian Pacific Islander, and White students. Educational researchers and political stakeholders consistently pointed to the trustworthiness and veracity of the experimental/scientific methods, and ignored how the processes support/ed White supremacy.

As a candidate for US President, Texas governor, George W. Bush, drew on the Civil Rights era discourse in his bid for the presidency. He declared "education is the greatest civil rights issue of our time," and that the nation faced a "reading crisis." He championed improving the reading outcomes for BIPOC and low-income students by highlighting the results of their reading performance as described in the *National Reading Panel Report* (2000) and NAEP data. Under President George W. Bush, Congress reauthorized ESEA as the No Child Left Behind Act (2001), along with Title I (*Improving the Academic Performance of the Disadvantaged, Part A, Basic Program*), Title III (*Language Instruction for Limited English Proficient and Immigrant Students*), Title VII (*Indian, Native Hawaiian, and Alaska Native Education*), and *Individuals with Disabilities Education Act* (IDEA), and later IDEIA in 2004. NCLB required states to assure adequate yearly progress was made by economically disadvantaged students, students from major racial and ethnic groups, students with disabilities, and students with limited English proficiency. Reading was recognized as pivotal to the effectiveness of NCLB and the national focus on reading resulted in significant increases in federal research funding. Underpinning the push for increased testing and support of scientific/evidenced-based results is the ideology of White supremacy, recast as a reasonable response to the literacy crisis. The failure of NCLB and subsequent ESEA authorizations, *Race to the Top* (2009) and *Every Child*

Succeeds Act (2015), to improve the literacy educational performance of BIPOC students indicates federal and legal remedies for racial injustice are undermined by systemic institutional racism.

State court cases

In the *Ella T. v State of California* case students in three different elementary schools won literacy for all California students based on the 14th Amendment. The plaintiffs' lawyers argued that California was doing a poor job of teaching students to read, and the performance of economically poor students on literacy assessments was a violation of the CA constitutional mandate, to provide equal access to education. An award of \$53 million was allocated to provide resources to the state's 75 lowest-performing elementary schools. In a similar case, a suit was brought on behalf of Black students in Detroit, MI in *Gary B. v. Snyder* (2016), also called the "right to read" lawsuit, followed by the *Gary B. v. Whitmer* case. Citing several alleged violations of the 14th Amendment as well as racial discrimination in violation of Title VI of the Civil Rights Act of 1964, 42, U.S.C., and 34 C.F.R. 1000.3(b)(2), the plaintiffs' lawyers compared the education received by the student Black plaintiffs to the education of their White students or peers. Their central argument was that Black students were not receiving an equal and equitable education and emphasized the reading instruction was inadequate and unable to propel them to a meaningful life or future. To be clear, these cases hinged, in part, on whether reading is a fundamental and constitutional right. After a series of appeals, the Sixth Circuit US Court of Appeals ruled that "students have a right to 'a basic minimum education,' which the court defined as giving students the opportunity to learn to read" (Peak and Hanford, 2020, n.p.). The ruling granted \$94.4 million to the Detroit Public Schools to improve reading programs, however, reading was not declared a Constitutional right.

In the nearly 70 years since *Brown*, BIPOC continue to legally demand the right to equal education, although what is considered an equal education remains undefined. In recent state-legal victories, the desire for an equal education has centered on access to literacy, especially appropriate reading instruction. Appropriate reading instruction is needed for all students to perform well on standardized reading tests required under reauthorizations of ESEA. However, a review of state laws and policies found that there are 30 states with reading retention laws, requiring students to read on grade level by the end of third grade or be retained. In Michigan, for example, during the 2015–2016 legislative session, MCL 380.1280f was passed and requires students to be able to read and write on grade level by the end of third grade. The devil is in the details, as there are accompanying exceptions that waive the requirement for students identified as dyslexic (the majority of whom are White and middle-to-high income), but not for students identified as SLD (the majority of whom are Black, Indigenous, and Latinx and low-to middle income). These laws ignore that historically the BIPOC students attend schools that have been underfunded and under-resourced (Browne-Marshall, 2013; Frankenberg et al., 2019; Gabriel, 2020), and are most often retained. Supporters of the legislation argue that the failure to read on grade level by the end of third grade is a predictor of later reading success and high school completion. DeLissovoy (2016) believes as positioned, their argument perpetuates "White ingenuity and generosity, and at the same time constructing interrogations of this narrative as unreasonable and inadmissible" (p. 353). There are numerous studies that do not support the finding of failure to read on grade level by the end of third grade increases the high school dropout rate, and acknowledge a disproportionate percentage of BIPOC students are retained under these state laws. Opponents submit the new laws reconstitute White supremacy—under the guise of "states' rights" to make educational decisions and the use of standardized state literacy tests as a cover for racist literacy policies. Historically, literacy has been weaponized to "remove people of color from economic, political, and social competition" (Browne-Marshall, 2013, p. xxxvi), and the most recent laws, as well as selective waivers, continue the process.

Beginning in 2020, a spate of new state laws was established, allegedly in response to the teaching of critical race theory, although it is not a theory taught in schools. The reasons given for new state laws (labeled as decency or parents' bill of rights'), ranged from barring the discussion and teaching of US history as systemically racist, to concerns about hurting the feelings of White students. In addition, under cloaks of "decency" some school districts have begun a massive overhaul of literature, primarily banning books that discuss issues of anti-Semitism; ethnicity/race/racism; and LGBTQAI+ issues. By contrast, the American Psychological Association (2021) admitted to racist actions made by, and, on behalf of the organization in the past. They acknowledged their support of scientific racism and White supremacy, provided a detailed chronology of past racist actions, recounted the failure to acknowledge and publish scholarship by Black researchers, and apologized for in/actions taken in their self-interest that harmed people of color. Moreover, APA resolved to improve, and presented a series of action steps to be implemented. Despite the stunning admission, federal and state laws, as well as local school board policies have been indefensibly silent about the announcement and have not announced any change in laws or policies to create more equitable standardized reading tests.

Looking forward

This history of literacy access in the US critiques the ideological roots of White supremacy and the false narrative that frames the founding and the democratic stance of the nation: the importance of European culture, language, literacy, and values; and the unfettered mischaracterizations about BIPOC as less-than-human, unintelligent, and without culture, language, literacy, and value. Glaude (2016) argues these ideas are reflected in US democracy as a fundamental belief that White people are more valued than all other people. His idea is noteworthy given the interpretation of the Declaration of Independence and the US Constitution, as well as US Supreme Court rulings that opine White people are the superior race and White people should dominate society. The discourse of the documents and US Supreme court cases appears to confirm the belief about the superiority of White people

over all other races. Harris (1993) theorizes that the sustainability of these ideas is premised on believing that, “whiteness meets the functional criteria of property” (p. 1731). From her perspective, Whiteness has value and the reality of Whiteness is tangible, “the law has accorded holders of whiteness the same privileges and benefits according to holders of other types of property ... it includes exclusive rights of possession and use and disposition” (p. 1731). Wilkerson (2020) believes America’s problems are deeper and prefers the notion of caste, “it’s much harder to look into the darkness in the hearts of ordinary people with unquiet minds, needing someone to feel better than, ...the toxins can infect succeeding generations” (p. 267). Beyond beliefs, customs, laws, and statutes the US legal system consistently has failed to reckon with the history of economic, social, and racial injustices while seeking to codify and normalize White supremacy.

As this examination of the nation’s literacy history and review of several federal and state laws reveals, there is a repeated pattern of compromising literacy equity for BIPOC, while simultaneously promoting a façade that new approaches, assessments, curricula, instruction, and laws, will ensure equitable literacy and racial progress. Attempts to federalize racial equality suggest that racial equality under the law is an insufficient response, as innumerable legal and political maneuvers successfully have dismantled, ignored, and sidestepped laws that provide racial reconciliation and the opportunity for equal education and literacy access. For nearly four centuries, literacy access for BIPOC has been criminalized, denied, derailed, and restricted. The counter-narratives in this chapter describe how (a) some people from Africa, Asia, and Central America (Mexico) were literate when they arrived in North America; (b) Sequoyia created a Cherokee syllabary and proved that literacy is not defined by, nor synonymous with, Whiteness; (c) Black people defied dehumanizing characterizations and laws to acquire, and, teach literacy; (d) literacy has been weaponized to subvert equal access to education; (e) literacy is a pathway to freedom and liberation and not a broad set of skills; and (f) BIPOC extended literacy to all people irrespective of economic status, ethnicities, and genders. In the twentieth century, White supremacy evolved within education following the Civil Rights Act and the establishment of ESEA. Congressional requests to better improve the literacy performance of BIPOC, for instance, resulted in experts drawing on scientific racism and experimental methods to socially control concepts, criteria, definitions, instructional approaches, materials, and measures of literacy. Every legal effort has failed to make a significant improvement in BIPOC literacy performance as measured by standardized achievement tests. Recent state court victories in California and Michigan confirm the Constitutional right to equal access to literacy. As a nation, however, we bear witness to a history of legal processes that have obfuscated the potential for authentic literacy access and educational equality. As a nation, it is important to acknowledge that rich literacy histories among BIPOC existed long before European settler colonialists invaded North America, and to understand that White supremacy informs and frames the false narrative used to deny literacy access to BIPOC. There is a moral imperative to create a novel narrative that: ensures equal education; defines literacy as a human right; and values the dignity of all humans as well as their cultures, ethnicities languages, races, and knowledge systems. Looking forward, literacy is paramount to anchoring US democracy, equality, equity, freedom, and justice.

This chapter presents a critical review of the category specific learning disabilities (SLD) in the United States (US).¹ Students with SLD make up the largest disability category in the US, consisting of 33% of approximately seven million students with disabilities (NCES, 2020). The use of the adjective “specific” and the plural noun to describe this condition (“disabilities”) speak to the complexities of this category. Indeed, SLD covers several language and psychological domains as reflected in the federal government definition:

a disorder in one or more of the basic psychological processes involved in understanding or in using language, spoken, or written, that may manifest itself in the imperfect ability to listen, think, speak, read, write, spell, or to do mathematical calculations, including conditions such as perceptual disabilities, brain injury, minimal brain dysfunction, dyslexia, and developmental aphasia. [SLD] does not include learning problems that are primarily the result of visual, hearing, or motor disabilities, of intellectual disability, of emotional disturbance, or of environmental, cultural, or economic disadvantage.

U.S. Department of Education (2018).

The conceptualization of SLD has a long history of tensions and ambiguities between biological origins and the role of contextual and cultural influences. In fact, as reflected in the exclusionary clause, the current definition suggests that SLD is orthogonal to cultural, environmental, and socioeconomic factors. These uncertainties trickle down to policies and identification practices that complicate the work of school professionals, which in turn, might mediate fluctuations in SLD prevalence over time. Moreover, the ambivalent connections between biology and context in the SLD definition have likely contributed to a history of racial and linguistic disparities in identification rates.

We argue that the conceptualization of SLD can benefit from an interdisciplinary analysis of the interlocking of learning with racial, cultural, and socioeconomic differences. Rather than keeping them apart, as if learning happens in places and times devoid of sociocultural influences, we advance an intersectional critique challenging the field to consider these complexities in the conceptualization of this condition. For this purpose, we present a brief historical overview of SLD, illuminating the connections to biological deficiencies and making visible the ways sociocultural differences (e.g., race) have historically been imbricated in the evolution of this concept. Next, we present an intersectional analysis showing how the notion of SLD has assumed a universalistic standpoint that has been largely shaped by federal policies that de-contextualize learning differences and focus on a unitary approach that focuses on SLD as the defining feature of this condition. Despite recurrent debates about the intersections of SLD with race, language and social class, the federal definition continues to exclude such intersections. We then demonstrate the importance of embracing a cultural vision of learning in SLD identification practices. We end with brief reflections for future SLD research.

A historical sketch of tensions in the conceptualization of learning disabilities

To begin, we recognize the importance of understanding how SLD emerged as a disability category, the ways it has evolved and developed over time, and how the early roots of SLD have contributed to contemporary challenges. Although SLD as a construct

¹It is important to note that we approach this chapter with a focus on SLD in the United States but recognize that many of the same challenges in the global North related to a focus on biological causes and ambiguous definitions are troubling the global South as well (Grünke and Cavendish, 2016). We also acknowledge the problematic influence of the global North regarding SLD definitions and identification processes that have encroached upon and exacerbated inequities in the global South (Kalyanpur, 2020).

was not adopted in US education policy until 1975, its origins can be traced back to nineteenth century Europe when the medical establishment focused primarily on the biological and neurological deficits of individuals facing challenges related primarily to the spoken language. A related research strand focused on reading disorders assumed to be linked to biological causes (congenital or hereditary factors) (Hallahan et al., 2013). At the time, studies included a focus on soldiers with brain injuries and their effect on language development. Building on this early "brain science," by the 1900s, research expanded to the US where the focus included children placed in facilities due to what was then described as "mental deficiencies." Today these children would most likely be identified with intellectual disabilities. As Danforth (2009) described, in the US, during the early twentieth century there was increasingly a focus on children who were believed to display forms of brain "dysfunction" despite these children not actually having experienced brain injuries. Werner and Strauss (1941), for instance, crafted behavioral profiles of these students by type of etiology, namely brain injury (exogenous) and poor learning backgrounds (endogenous). This was a key moment in the conceptualization of SLD given the assumption that learning differences observed in children were due primarily to either biological factors (brain injuries) or cultural (environmental) deprivation. These early views about problems related to "language, memory, behavior, and learning difficulties initiated lasting ideas and also deep conceptual tensions that continued in multiple forms through the developing field of learning disability research for many years" (Danforth, 2009, p. 29). In this sense, the medical model was pivotal given the focus on language and learning difficulties and critical to its development as a category of disability; but as we explain below, we have also witnessed intermittent attention to a cultural deprivation hypothesis over time.

While the focus in the early 1900s was primarily on observing and explaining learning differences, this was followed by a period of focusing on diagnoses, assessment tools, and interventions to address mainly reading disabilities. Approaching the mid 20th century, Monroe (1932) offered the notion of a discrepancy between actual and expected achievement to conceptualize reading disabilities which has had a lasting impact on the definition of SLD (Hallahan et al., 2013). It was not until 1963, however, that Sam Kirk was credited with coining the term *learning disabilities* in his address to parents of "perceptually handicapped" children. He defined the condition as:

[A] retardation, disorder, or delayed development in one or more of the processes of speech, language, reading, writing, arithmetic, or other school subject resulting from a psychological handicap caused by a possible cerebral dysfunction and/or emotional or behavioral disturbances. It is not the result of mental retardation, sensory deprivation, or cultural and instructional factors

Kirk as cited in Hallahan et al. (2013, p. 22).

It is interesting that Kirk considered "instructional" influences as an exclusionary factor in the early definition, which serves as a reminder of the importance of educational opportunity in shaping learning difficulties. A year later, in 1964, the Learning Disabilities Association of America (LDA) was founded and four years later, the Council for Exceptional Children established the Division for Children with Learning Disabilities.

It is important to note that the early federal definition of SLD stressed the biological underpinnings of this disability, grounded in cognitive and behavioral models. Furthermore, the impetus for the definition's exclusionary clause was to differentiate this population from other groups for the purposes of securing resources. This is not surprising since the recognition of cultural identities (e.g., poor, disabled, racial groups) in the pursuit of justice agendas is linked to the redistribution of resources (Fraser, 2007). Thus, advocates worked to secure the recognition of learners with disabilities to obtain education funding and entitlements. This is tricky work because redistribution decisions are generally attached to particular categories in the chessboard of identity politics. Thus, advocates supporting the inclusion of SLD in federal policy were concerned that other groups struggling with reading—i.e., racially minoritized students and students living in poverty—might be included in this category, thus increasing the number of eligible beneficiaries and boosting the costs associated with the emerging policy (Martin, 2020).

We should note, however, that other cultural-historical forces have been at play in efforts to exclude "environmental, cultural, or economic disadvantage" from the definition of SLD—what Kirk first described as "sensory deprivation or cultural factors." These influences were already present during the early years of brain injury and learning impairment studies and have been intricately interwoven in a longstanding project of "othering" certain groups in US society. For instance, the notion of "backwardness" emerged in the early 1900s to describe children who were of "normal intelligence" but did not meet what was deemed adequate progress in school (Franklin, 1980). It was common to blame cultural and socioeconomic factors as primary explanations for "backwardness." As Franklin (1980) argued, "backwardness" was linked to how researchers later framed learning disabilities in an attempt "to control sources of cultural diversity within the population in the name of cultural homogeneity and the hegemony of the native middle class" (p. 18). In subsequent decades, a distinctive view of success and competent performance has been enforced in educational systems which has consistently marginalized low-income and racialized groups, including recent immigrants (Deschenes et al., 2001).

A related cultural-historical influence is the idea of "culture of poverty" (and its cognate "cultural deprivation") which emerged in the 1960s at the height of racial tensions and the struggle for Civil Rights for people of color in the US. These notions were used to describe mostly minoritized groups, but also all poor people, who were perceived to be "severely handicapped by home environments that lacked environmental stimuli" (Sleeter, 1986, p. 49). This characterization was consistent with the historical trope of

deficit thinking to describe and treat communities of color (McDermott and Vossoughi, 2020). The culture of poverty model assumes that the self-perpetuating mechanisms through which culture impairs children's learning are socialization or deprivation processes. In this view:

[c]hildren either learn skills and dispositions [in their cultural communities] that are not useful for school learning ... [socialization] or the children's culture prevents them from learning certain skills, habits, or values that prepare them for success in school (deprivation). The premise in the cultural deprivation hypothesis is that living under certain conditions (e.g., poverty) exposes children to cultural practices that limit the acquisition of normative bodies of knowledge, dispositions, as well as skills, and limits access to experiences that are valued by the dominant society. In this view, "the culture of poverty" deprives children of sound developmental experiences and becomes destiny ... [T]hese two understandings of the roles of culture in learning are problematic on two counts: they rely on limited definitions of culture and lack theoretical specificity.

Artiles et al. (2010, p. 291).

These stratifying undercurrents have permeated the history of US society and have certainly influenced the development of categories like SLD, including its exclusionary considerations. Unfortunately, the culture of poverty has resurfaced, again (McDermott and Vossoughi, 2020). Meanwhile, the definition of SLD has continued to be revised over the years, though the core features of this category including a discrepancy model (between child potential and achievement) have remained in place, as reflected in the current definition presented in the introduction of this chapter.

The longstanding tension between (assumed) biological causes and exclusionary cultural/socioeconomic considerations has also persisted and has contributed to conceptual ambiguities and dilemmas in identification practices. For instance, the SLD population (of mostly white middle class students) grew substantially in the early years of the federal category. Over time, however, African American learners migrated to this category from the intellectual disability classification, in part due to litigation related to bias in identification (Donovan and Cross, 2002). In fact, the representation of low-income African Americans and Native Americans in the SLD category grew in the subsequent decades after its inception in several geographical regions, despite the definition's exclusionary clause.

This historical context sets the stage for contemporary challenges related to SLD, particularly given the disregard for how racial, socioeconomic, and cultural differences and contextual factors intersect with this disability. In the next section, we critique this logic by offering insights from intersectionality to overcome the shortcomings of a universalistic approach.

Intersectional framing of SLD: moving beyond a unitary approach

We use an intersectional lens to discuss key policy and definitional issues related to SLD that have beleaguered the field. These issues have created conceptual ambiguities and blind spots that have consequential ramifications for diagnosis and research practices. More specifically, we draw from intersectionality theory (Crenshaw, 1989, 1991) to critique the unitary approach (Hancock, 2007) to policy, focusing specifically on the limitations of the exclusionary clause in the SLD definition. The unitary approach privileges a "universalistic perspective in which one 'variable' or marker of difference, such as [cognition], race or class, is assumed to be both more important than the others and stable" (Artiles, 2013, p. 337). This universalistic approach leads to what Hancock (2007) refers to a "logic of group solidarity" (p. 65), or the assumption that a single, unitary category "serves to bind people into a political group based on a uniform set of experiences" (p. 65). In this case, the assumption is that psychological or biological factors are the defining features of learning disabilities.

In order to advance an intersectional framing of SLD, we critique the unitary approach that informs SLD scholarship and policy. For this purpose, we discuss (a) how the unitary approach shapes the construction of double bind identities; (b) the limits of the unitary approach associated with the erasure of historical legacies of inequity, the reliance on epistemic cultures that ignore culture and other markers of difference, and the lack of attention to ideologies of difference that may perpetuate the racialization of SLD despite the exclusionary clause; and (c) why the SLD field needs to engage with robust views of culture to enrich its knowledge base. We end the chapter with a brief reflection on future directions for SLD research.

Disrupting double bind identities: the promise of intersectionality

The history of the SLD exclusionary clause reveals efforts that were made to exclude race, culture, poverty, and environmental factors from consideration in identification practices. Yet, despite the clause, SLD has been racialized over time. This means that although a diagnosis affords educational opportunities to students with SLDs, new inequities can unwittingly emerge for students located at the intersection of ability, racial, socioeconomic, and cultural differences as reflected in the racialization of disabilities. Indeed, the quest for educational equity for students with disabilities has been fraught with paradoxes and inequities that create double bind identities for students as disabled *and* racialized (Artiles, 2011). Both categories bring stigma and disadvantage, and a complicating factor is that each category rests on disparate notions of justice—students with disabilities have sought *differential* treatment through individualization, while racialized learners have struggled for *equal* treatment through the abolition of segregation and equal access to resources. This situation has become more complicated as students with disabilities now aspire to be treated the same (via the standards movement) *and* differently (through individualization) (McLaughlin, 2010). In the end, these students acquire double

bind identities and are positioned in contradictory circumstances as the remedy for one group—e.g., special education—can unwittingly have detrimental consequences for other groups—e.g., students of color—through placement in more segregated settings or with limited access to the general education curriculum or related services than their white counterparts *with the same disability label*; thus, muddling the effects of well-intentioned efforts to expand equity.

An intersectionality lens exposes the limitations of the unitary approach (Crenshaw, 1989, 1991), revealing gaps and silences in single-category approaches to research, policy, and the law. To illustrate, policies focused on racial inequality tend to emphasize the experiences of Black males while gender equity policies implicitly focus on white women; thus, marginalizing the needs and experiences of African American women (Crenshaw, 1991). Additionally, an intersectional approach reveals how interlocking oppressions at the macrolevel (e.g., racism and ableism) become enacted in the day-to-day lives of people of color (Connor et al., 2016). In this way, intersectionality enables us to examine the different experiences and opportunities afforded to students of color and white students *with the same disability label*. Thus, from a structural intersectionality perspective, learners located at the intersection of racialized and disabled groups have qualitatively different experiences than students not positioned at this juncture (i.e., students with disabilities or racialized learners). From a political intersectionality standpoint, racialized students with SLD are given identities that pursue different (often conflicting) equity agendas, as explained in the preceding paragraph. For multiply marginalized learners, conflicting equity agendas contribute to schools acting as sites of dispossession where schools become more focused on surveillance and control, stealing essential time, resources, and relationships from students (Fine and Ruglis, 2009; Tefera, 2019).

As Hankivsky and Cormier (2011) note, intersectionality, similar to other critical frameworks, reveals the ways laws and policies are not neutral nor are they experienced in the same way by all people, contributing to key differences that have to be taken into account when developing, enacting, and evaluating public policy. To this end, intersectionality promises to disrupt these double bind identities by demonstrating how education policies often fall short in addressing the needs of learners at the intersection of multiple categories of difference, which is evidenced in the federal SLD definition. A growing number of scholars are demonstrating how policies can be written and enacted in a way that considers intersectionality (Hankivsky and Cormier, 2011). For instance, Bishwakarma et al. (2007) provide guidance on how to systematically integrate intersectionality in the policy-making process by structuring the problem in a way that considers how various social groups may experience a defined policy differently within specific contexts. In this way, there is a focus on the intersectional nature of the problem and the ways corresponding policies can more appropriately meet the intersectional lives of learners.

Dangers of the unitary approach: history, epistemic cultures and ideologies of difference

The unitary approach to define SLD raises difficult questions about this field and has important implications for research and practice. First, the exclusive attention to psychological factors erases problematic historical antecedents of contemporary conceptions of student competence. For instance, while practice dictates that teachers hold expectations for students that are “grade appropriate,” students who do not respond within an “acceptable” range are often regarded as falling outside of the prescribed “norm” (Reid and Valle, 2004). We must remember, however, the idea of the “normal child” is historically intertwined with race and other forms of difference in complex ways. After all, “disability has refused to remain linguistically stable On the one hand, disabled populations remain segregated and marginal throughout history. On the other hand, cultures persist in creating difference into a paramount trope of the human condition” (Mitchell, 2009, p. ix). For example, people of African descent were viewed as sub-human based on biological assessments such as cranium measurements that were used to justify the degradation of African Americans through policies and practices, including slavery, racial segregation, and unequal opportunities (Valencia, 1997). The history of IQ testing is also fraught with questions of cultural bias that disadvantage students of color and reduces their educational opportunities. Alas, the historical entanglements of race and ability are enmeshed in schools today (Artiles, 2019). Racial disparities in identification, discipline, and the segregation of students of color with disabilities are just some of the enduring injustices in US schools and the SLD field cannot afford to ignore these historical legacies (Skiba et al., 2016). We must remember that societal struggles surrounding inclusion and segregation of distinctive groups signal critical tensions that constitute its very core. For this reason, intersectional analysis of SLD should not be concerned only with the history of this condition, but with unveiling “what is most hidden under this history” (Stiker, 2009, p. 19).

Second, the requirements of the exclusionary clause call for attention to specific sociocultural markers. Yet, most SLD research has ignored these considerations. For instance, there have been efforts to expand research practices through more comprehensive descriptions of research samples (e.g., intersections of race/ethnicity, language, socioeconomic status). The Council for Learning Disabilities (CLD) and the National Joint Committee on Learning Disabilities (NJCLD) set minimum standards for including demographic markers of SLD students within research (Reed et al., 2012). Nonetheless, published studies continue to overlook how social categories intersect with SLD, particularly for Native American, Asian, and emergent bilingual learners (Reed et al., 2012).

Ironically, more than half of states in the US (33 out of 50) identified emergent bilinguals for SLD at a higher rate than the national average, with identification rates as high as 65–70% of emergent bilinguals in some states identified with SLDs (WIDA, 2017). Furthermore, when students of color are disproportionately identified with SLD, they are more likely to be placed in segregated special education classrooms compared to white students with the same diagnosis (Fierros and Conroy, 2002). These are unsettling practices that demonstrate the ways students of color with SLD can experience the label and presumed accompanying

supports in differential ways, despite the presence of the exclusionary clause. Given the lack of attention to exclusionary categories in research reports, should we assume that researchers consider these factors irrelevant? What factors maintain the erasure of environmental, cultural or economic considerations in research papers in the SLD field? These questions challenge the SLD field to take a critical look at its own knowledge production practices and take corrective measures where needed.

Third, how do practitioners manage to racialize the SLD category in certain locations despite the conceptual blinders encoded in the definition's exclusionary clause? Let us consider, for example, the case of Response to Intervention (RTI). RTI is a tiered system that includes assessments and interventions to support student achievement and address behavioral challenges. RTI provides opportunities for states and school districts to use alternative processes that circumvent the limits of the discrepancy formula approach to determine whether a student has SLD. Although The Individuals with Disabilities Education Act (IDEA) does not require schools to adopt RTI, many schools now use *both* the discrepancy model and RTI. Initially hailed as potentially addressing persistent equity challenges, including racial disproportionality, uncertainties and misunderstandings about how to implement RTI with fidelity in school systems serving heterogeneous populations and how to diagnose SLD with evidence from RTI have been reported from various states (Deshler, 2015).

For example, in a study examining the relationship between RTI and SLD disproportionality, Bouman (2010), found that although there was a decrease in the overall number of students identified with SLD, there was an increase in the disproportionate identification of African American students with learning disabilities. Similarly, Hartlep and Ellis (2012) found that RTI did not significantly reduce the likelihood of SLD identification, including for African American and Native American students who remained disproportionately represented. Thus, the intersectional aversive logic of the SLD definition and unitary focus on interventions and identification practices ultimately fall short in addressing key equity challenges that have plagued the field. How do we explain the persistence of the racialization of SLD across various identification models? Are there *ideological assumptions about the competence of students of color* that permeate these identification practices (Artiles, 2020)? An intersectional analytic framework, with its attention to historical legacies and hierarchies of power in social categories, promise a useful resource to examine these puzzling trends.

Why culture matters in SLD identification practices

We explained in the history section above the impetus for the exclusionary clause, particularly the focus on "environmental, cultural, or economic disadvantage." Two factors contributed to the inclusion of the clause. First, a concern with group recognition and access to resources. In fact, the terms included in the clause were code for "poor and racialized groups." The goal was to keep these groups outside of the SLD prevalence to protect budget allocations in the federal policy. Second, we situated the choice of the clause terms in the context of the 1960s in which the notion of "culture of poverty" and "cultural disadvantaged" were in vogue. These terms were loaded with ideological assumptions that kept structural inequalities invisible while they perpetuated the pathologizing of students of color (Scott, 2007). Here we return to this history to clarify why we need attention to culture in SLD, but also why it is necessary to avoid colonial conceptions of culture.

First, we underscore the importance of recognizing the cultural nature of human learning and development (Rogoff, 2003). The underlying view of culture in this perspective is dynamic, historically grounded and instrumental. A basic premise is that culture is *not* destiny; people *reproduce* the cultural practices learned at their homes and communities, but also *produce* new cultural practices through improvisation and borrowing from other groups—the latter point is significant because it prevents the stereotyping of cultural group members. Learning is cultural because human beings learn through mediation with cultural (psychological and material) artifacts and develop multiple and hybrid cultural repertoires as they participate in various communities (family, peer, school, recreational, etc.) (Artiles, 2015).

Unfortunately, rather than focusing on the cultural resources that students bring to the classroom and the cultural tools they deploy in their learning processes, culture and context are overlooked in the diagnosis of SLD. This results in an identification process that is largely driven by a vision of a-cultural human beings and that is reinforced by a system fixated on technical compliance with federal and state identification laws—i.e., driven by rules and regulations that tend to standardize subjects.

A cultural vision of learning compels professionals to understand students' sociocultural backgrounds and contexts when engaged in assessment and teaching processes. Yet, these considerations are often neglected in SLD identification practices (Fletcher and Navarette, 2011) or addressed with a unitary logic in which cognitive or biological considerations are paramount. In contrast, the perspective we subscribe to avoids stereotyping of students based on static proxies of culture such as racial background. Instead, it directs attention to the intersectional repertoires of practices and tools that individuals curate over time as they participate in multiple cultural communities.

Thus, a Latinx girl in middle school would likely develop repertoires through participation in her nuclear and extended families, her peer affinities with school, neighborhood and social media communities, as well as through her participation in other groups (e.g., sports, recreation, cultural, volunteer activities). In all of these social spheres are intersections of gender, linguistic, racial, ethnic, social class, and sexual orientation identities. This young learner still has primary affiliations in which she has acquired the core of her cultural practices, but she has likely curated hybrid repertoires derived from her multiple affinities. A *structural intersectional analysis* of her repertoires would assume that identity intersections place her, depending on the situation, in a particular social location; sometimes affording privileges, other times closing opportunities; thus, making her experiences as a Latinx adolescent both comparable and different in some respects to other peers of similar and distinct racial/ethnic identities.

In turn, a *political intersectionality* analysis would examine the political agendas of her various identities, searching for potential contradictions and documenting the consequences. For children and youth who are members of subordinated groups that may have conflicting agendas—e.g., racialized and disability groups—the consequences are considerable. As Crenshaw (1991) explained, “[t]he need to split one’s political energies between two sometimes-opposing groups is an additional dimension of intersectional disempowerment” (p. 360). This is why it is imperative that student school performance is informed by intersectional analyses that transcend stereotypical conceptions of culture and identity that often reify negative portrayals of students of color.

There is a second, equally significant, conception of culture that is relevant to the SLD field. This view focuses on the *cultural practices of institutions* (Gallego and Cole, 2001). For instance, schooling cultural practices rest on assumptions about what constitutes student competence, what curriculum content is worth prioritizing, what question formats and types of student behavior are acceptable to gauge learning. Instructional routines, ways of participating in classroom discourse, and seating arrangements also reflect the institutional culture of schools. Similarly, deficit-laden ideologies that assign static and stereotypical views of culture to students of color often permeate school culture. The idea of “culture of poverty” which sustains a damaged imagery of students of color (Scott, 2007) is an enduring example.

It is not uncommon to see this kind of ideology underlying explanations of the racialization of disabilities. For example, in a study we conducted with colleagues (Tefera et al., under review) we examined suburban school districts frequently cited for racial disproportionality in the identification and disciplining of multiply marginalized learners. We found that leaders and educators subscribed to deficit perspectives and a damage imagery related to the cultural practices of the increasing number of families of color who moved into the school district. We documented how deficit tropes were enacted given educators’ perceptions that the historically “high expectations” and “high achievement” of the school district was interrupted by families of color who, while searching for greater opportunities for their children, embodied cultures that were deemed to be misaligned with the culture of high expectations in the district. In a predominately white school district, African American students’ multiple identities (e.g., gender, sexuality, income, etc.) and cultural assets were ignored, with the key assumption being that African American students were unprepared and thus did not belong in the district. One of the key consequences, therefore, was that educators’ practices were left relatively unexamined since the problem was in the (essentialized) culture of students, families, and communities who were determined to be in need of changing and conforming to the expectations of the district.

Institutional cultural practices are also encoded in RTI protocols. The unitary focus of the SLD definition aligned with RTI’s uses of interventions and monitoring strategies that target cognitive skills devoid of the cultural repertoires that students of color bring from their communities may worsen inequities for multiply marginalized learners with SLD. These challenges make it essential to disrupt “the cultural inclination to focus on what is wrong with individual children ... [and] seek data showing children more skilled than schools have categories or time to notice, describe, diagnose, record, and remediate” (McDermott et al., 2006, p. 15). A number of scholars are focused on the cultural assets and practices that encourage a dynamic relationship between students’ cultural repertoires and school cultural practices (Bang et al., 2016; Gutiérrez and Rogoff, 2003). It is therefore essential that the assessments, interventions, instructional methods, and educational goals account for the complex intersecting identities and cultural practices that students bring to schools and classrooms.

Reflections for future SLD research

Our intersectional critique of SLD raises questions about difference and equity that are often neglected in this field. The ambiguity of the current definition and the ways it has been enacted have contributed to a situation in which learning difficulties associated with poverty and racialized status are presumably kept apart; yet we continue to see students from such groups differentially placed in this category. This paradox is connected to the dual nature of disability as an object of protection and a tool of stratification (Artiles, 2011), and it is sometimes perpetuated by the very legislation created to disrupt disability inequalities. Mitchell (2009) illustrates this point regarding the American Disabilities Act (1990), explaining “[l]egislation is concerned only that disabled people *pass the threshold to invisibility*. We reference the ADA as an indicator of our society’s commitment to social justice while failing to achieve demonstrable evidence of its successful implementation” (p. xiii, emphasis added). We must break these circuits of miseducation through the deployment of intersectional analytic practices, especially because educational equity tools (i.e., special education) can be unwittingly used to make students of color further invisible.

We must also note that although this chapter focuses on SLD in the US, a growing number of scholars are discussing the hegemonic narrative of disability identification practices and policies in other regions of the world (Grech, 2015; Kalyanpur, 2020; Werning et al., 2016). This is particularly noticeable in efforts to transfer disability knowledge across national contexts, particularly from the global North to the South.² Indeed, the global North and South are not merely “a geographical

²We do not frame the terms Global North and South based on a binary logic. Rather, we use the terms “to delineate power, resource, epistemological and other differentials, that though not unshiftable, and though not localized, embrace a substantial portion of the world living in a scenario of profound geopolitical asymmetries, poverty and isolation confronting deeply entrenched centers of concentrated wealth and power accumulated historically and perpetuated in times of coloniality. There is not one global South, but there are indeed many global ‘Souths.’ Furthermore, the global South is not only present in, but it also lives within the global north” (Grech, 2015, Terminology section, para. 3).

delineation of space, but a historical and sociological context that has traditionally excluded and disadvantaged certain communities of people" (Kalyanpur, 2020, p. 296). Kalyanpur (2022), for example, demonstrates the troubling parallels between SLD in the US and India, asking key questions about the role of power in the construction of SLD in India, including *Why is the label [SLD] itself based on the American definition? Why does the emergence of this category [SLD] look similar to that in the US?*" (p. 16). These questions are relevant and important not only to India but many parts of the global South that are adopting disability approaches from the global North, particularly given the ambiguities and intersectional shortcomings of SLD definitions described in this chapter.

At the same time there are important advancements in the field of SLD. Researchers, for instance, have mapped specific areas of the brain involved in aspects of reading (e.g., recognition of single words) and are documenting that the brain anatomy, physiology, and functionality of individuals with dyslexia differ from the brain of individuals without dyslexia (Artiles et al., 2020). Intervention studies are showing that some of the under-activated brain reading areas can be activated.

Most importantly, recent brain studies have shown that successful interventions change both physiology and anatomy broadly throughout the extended reading networks, including the prefrontal cortex, the right hemisphere, and in medial areas (cingulate cortex and insula) as well Researchers have interpreted these changes not as "normalization" but as *compensation*—the reading disabled reader's brain is compensating for weaknesses by *recruiting new areas of the brain into a different kind of reading network*. This suggests there is *great diversity in the parts of the brain that reading requires, and great diversity among individuals in the kinds of reading brains they develop*

Artiles et al. (2020, p. 166, emphases added).

Therefore, a key insight from recent neuroscience research is that "the brain's potential is not simply a matter of preprogrammed specialized modules but depends crucially on culturally organized experience" (Artiles et al., 2020, p. 162). For this reason, it is necessary to frame human development as constituted by bio-cultural influences.

Additionally, scholars are advancing research on how to engage in an intersectional policy approach. An intersectional policy approach would consider not only multiple categories of difference within the SLD category, but also situating policies within historical and social contexts. Furthermore, an intersectional policy approach links "educational outcomes with the context of people's lives—that is, where they live and how this is linked to job and food security, unemployment, and health insurance" (Hankivsky and Cormier, 2011, p. 227). In this sense, an intersectional policy approach recognizes and aims to address the interlocking of multiple structures of oppression that shape students' lives and opportunities. There is also growing scholarship in the US and abroad focused on redefining the boundaries of intersectionality in policy in ways that consider the voices of marginalized learners (Robert and Yu, 2018). Indeed, an intersectional policy approach that considers multiple categories of difference, context, interlocking of oppressions, and student voice holds important promise for future SLD research.

New advancements have also been made in the types of interventions that embrace the complexities of culture and students' intersectional lives. For example, Bal et al. (2018) demonstrate how to redesign interventions related to behavior that includes a focus on culture with Culturally Relevant Positive Behavioral supports (CR-PBIS). Although Bal et al. (2018) focus on an intervention related to behavior, it is equally critical that interventions focused on SLD such as RTI expand in ways that embrace students' multidimensional lives and dynamic notions of culture. Specifically, CR-PBIS focuses on bringing school community members and stakeholders together, including students and their families, to reflect on patterns in data, including disciplinary outcomes to improve practices and initiate transformation within a situated context. CR-PBIS is one of few interventions designed to explicitly consider students' intersectional lives, culture, and context to improve equity, and provides an important roadmap for similar advancements related to SLD interventions.

In summary, in this chapter we discuss the roles of biological factors and cultural influences that have been significant in the history of SLD. The former has dominated causal explanations while the latter has been taken up in ambiguous ways—i.e., at some point as a means to secure resources, other times as expressions of historical archetypes that advance the othering of students and communities of color. In addition, we outline the importance of embracing an intersectional framing of SLD by disrupting the unitary approach that informs SLD scholarship and policy. Specifically, we discuss the limits of the unitary approach associated with the erasure of a history of inequities, including culture and other markers of difference. We also demonstrate the need for the field of SLD to engage with more robust views of culture to enrich the current knowledge base. Finally, we believe that important advancements in scholarship focused on the biological layers of SLD, an intersectional approach to policy, and more dynamic engagement with equity and culture in interventions hold promise for enriching current conceptualizations and practices related to the field of SLD.

Acknowledgments

We are grateful to David Connor, Scot Danforth, Michael Gerber, and Todd Fletcher for their insights and expertise regarding the history of SLD in the US.

Background

Part I of this review addresses the U.S.–Mexico Borderland/La Frontera, The Frontier, the new mestiza, culture and increasing language uses or mixing on the border. The Texas-Mexico Borderland is at the same time a land mark for acquiring new literacies. In Part II, comparisons are made to other border communities, particularly those border communities surrounding Israel, in Beer-sheba, land near the Gaza Strip, that is of interest to geographers and historians studying Bedouins and multi-cultural communities. Part III offers proposals for constructing a unique teacher education that will be vital for designing language and literacy for border populations.

Crossing borders holds potential for transforming of the Self and constructing a new, multilayered identity. However, this opportunity is also fraught with challenges which educators and researchers must address. In this essay, attention to Borderlands contribute to our understanding of how adolescents conceptualize who they are and will become as they grow into adulthood while encountering more than one culture. The goal of the essay is to extend educational research to what has been a too long-neglected investigation of unique language and literacy education for border populations.

Characterizing the traversing of borderlands

Since adolescents growing up today on the United States-side of the Texas-Mexico Border (e.g. in El Paso, Brownsville, Laredo) travel routinely to and from Mexico, opportunities abound for interacting with family, friends, in neighborhoods in urban and rural Mexico. Cross-linguistic and cognitive-cultural shifts have begun to enter institutions of learning and classroom practices (Alvarez, 1995; Bhabha, 1998). On the United State -side of the border, “standard” English is typically perceived as the prime vehicle for literacy and upward mobility by teachers and students-alike. On the Mexico-side of the border, (e.g. in Neuvo Laredo, Metamoros) family interaction is in a first language, typically Spanish, with intergenerational registers or vocabulary. Spanish is viewed as the mark of cultural affiliation. What Joshua Fishman (1966) referred to in his seminal book, as a *Language Loyalty*. Cognitive-cultural shifts with intersections of cultures, in presentation of the self and voice, are common in oral discourse on each side of the border. These language shifts, with related cognitive realignments, are frequently a source of internal or externally expressed identity conflicts that our research team and others have addressed (Anzaldúa, 1987; Barrera, 2007; Horowitz, 1995, 2013, 2023; Hudson, 2014; Rodriguez et al., 2019). Adolescents here and elsewhere are typically engaged in exploring their identity, as they encounter language conflicts and/or mental struggles based on an “internal” and “external” landscape (Csikszentmihalyi and Larson, 1984; Jiménez,

2004). More recently, [Dyrness and Sepúlveda \(2020\)](#) describe Latinx youth with a “border thinking” with a cognitive perception that they are framed as “outsiders”.

Gloria Anzaldúa opens her seminal book with a portrait of living on the Texas—U.S.-Border, an account that may reflect the mind-set and emotions of many border residents. She describes her Border-identity in the following wrenching way:

I am a border woman. I grew up between two cultures, the Mexican (with a heavy Indian influence) and the Anglo (as a member of a colonized people in our own territory). I have been straddling that tejas-Mexican border, and others, all my life. It's not a comfortable territory to live in, this place of contradictions. Hatred, anger and exploitation are the prominent features of this landscape.

Preface to first edition, 1987, paragraph 2.

Relevant to the research about adolescent literacy habits to be reported below, Anzaldúa conveys how reading of books and oral language were central to her life.

This book, then, speaks of my existence. My preoccupations with the inner life of the Self, and with the struggle of the Self amidst adversity and violation; with the confluence of primordial images, with the unique positions consciousness takes at these confluent streams; and with my almost instinctive urge to communicate, to speak, to, write about life on the borders, life in the shadows.

Books saved my sanity, knowledge opened the locked places in me and taught me first how to survive and then how to soar ... The switching of ‘codes’ in this book from English to Castillian Spanish to the North Mexican dialect to Tex-Mex, to a sprinkling of Nahuatl to a mixture of all of these, reflects my language, a new language—the language of the Borderlands.

Preface to the first edition, 1987, paragraph 5.

Crossing borders: increasing opportunities for language, literacy, and identity self-positioning

The crossing of borders may be a life-changing event. It serves a variety of psychological functions. First, the “Crossing of a Border” forces adolescents and youth to interact with multiple-cultures and peoples—concomitantly, ways of speaking and thinking. The youth who cross borders, “transborder students” have access to multiple language styles, registers, and literacies—from newspapers, magazines, videos, genres of the oral within writing, such as poetry or songs, and music genres. Borders are the bridge for transitions in identity forming by hybrid cultures ([Canclini, 2005](#)). Historically, individuals remained on one side of a border whereby crossing a border was infrequent and burdensome. Or it was legally prohibited. With use of modern transportation, the opening of borderlands, and traversing through media, travel to and across borders is manageable and a frequent occurrence, especially among adolescents ([Brown et al., 2002](#); [De la Piedra, 2010](#)) bearing the energy and mindset. Transborder-students often live in Mexico but attend school in the U.S. given determination for a good education, coupled with possession of proper documentation. Still other transborder-students develop penpal programs in border spaces ([Perez, 2010](#)).

Second, Borders, themselves, are fluid. They change. They may be marked by bridges, or a fence, wall, line, a strip, river contributing to *how* border crossers traverse across nations. Youth frequently, rapidly respond to change and intersections. For example, the Russian-Border became Poland. It, later, was occupied by Russia ([Stoklosa, 2012](#)). With different leadership and regimes, borders have shifted whereby travel expanded or was constrained depending upon the leadership. With border populations and activity shifting, so have governmental expectations of travelers and traveler expectations of the self. Today, borders are often associated in the news with immigration restrictions, monitored by a border control ([Berry et al., 2006](#)). They have been characterized by a visual presentation on a map but also by a mental map that resurfaces in one’s mind.

This demarcation on a *physical map* or a *mental map* is referred to as a Border. In this chapter, the term Border refers not only to the physical separation of land but also encompasses the socio-cultural and psychological dimensions of the separation of space and land that persists within oneself. The Border is a means for adolescent “positioning” of one-self, what [Nelson et al. \(2016\)](#), [Nelson et al. \(2008\)](#) refer to as forming an “identity positionality”. This is a means for positioning oneself in one or multiple cultures, history, or local situation, to be described in more detail below. This positioning may influence one’s thinking about a community, friend-peer groups and the “other” ([West et al., 2019](#)). Positioning oneself *around* or *on* borders may influence attitudes toward a language, an audience, or the pursuit or neglect of higher schooling. Early on, high school students decide they are “more” Spanish-than English-centered. Their language of choice may contribute to whom they interact with most readily, and where they encounter daily friendships or disheartening conflicts ([Kosmutzky and Patty, 2016](#)). It may also contribute to their expectations for literacy—what language they read or how they write or speak ([Lam, 2009](#)). Wherever is “home,” determines oral and literate practices ([Guerra, 1998](#)) and spoken and written modes of meaning ([Halliday, 1987](#)). Maya [Hickmann \(2003\)](#) and [Hickmann and Robert \(2006\)](#) highlight challenges of space and time across languages. [Horowitz \(2017\)](#) describes adolescent literacy achievement from a global perspective and research that characterizes language conflicts and how high levels of literacy appear to be declining worldwide. While useful, such research often neglects to consider the uniqueness of specific border populations, the goal of this discussion.

Border affect and emotional encounters

The Borderlands of interest here are also associated with emotions, as [Anzaldúa projects \(1987\)](#). Border lands have historical, cross-generational meanings that provoke the emotions of pain, joy, spirituality, passions. In Israel, the land takes on a “holiness” and is treasured by Jews, Christians, and Muslims. Each group takes pilgrimages to historical sites ([Berger, 2011](#)). Wars, battles conveyed in the Bible, by cultures of the past are reiterated today with distinct meanings in written news reports, liturgy, or poetry. Today, battles are fought throughout the world for possession of land and control of borders. Along the Gaza Strip, conflicts have resulted in near-daily missile attacks on Israel, which cause significant trauma to its peoples.

Recent growth of hispanic population and in educational research

[Gándara \(2017\)](#) who served as Coordinator of the Civil Rights Project at UCLA, and Chair of the Working Group on Education for the California-Mexico initiative highlights the rich promise of Latino students. Without doubt, Latinos comprise the largest minority group of the U.S. population. In 2017, one of four K-12 students in the U.S. were Latino/a, with principle locations in California, New York, and Texas. She argues that more students have left the United States than have entered as immigrants, with 90% born in the U.S. (2017, p. 4). One may turn to numerous scholarly journals, to witness the increase in educational research of Hispanic populations and literacy education in schools as in the *Journal of Literacy Research* or the *Reading Research Quarterly* or *Reading and Writing Quarterly*. In fact, Hispanic populations have become the largest minority in the U.S. with significant variations in languages, lifestyle, and travels.

Part I Language and literacy educational research on the Texas-side of the U.S. Mexico border

The Border Literacy Project at The University of Texas at San Antonio included study of a high school on the Texas-side of the Texas-Mexico Border, where Hispanic adolescents travel daily by foot across a bridge, for a sheer 20 min to Mexico ([Horowitz, 2006](#); [Horowitz et al., 2009](#)). We have been interested in (a) how this travel influences transitional, transnational cognition (b) what positive language or literacy interactions and dire conflicts emerge among adolescents who are speaking English and/or Spanish when they travel across boundaries and (c) literacy choices that students make based on aspirations. This research has been reported in *A Bilateral Perspective on Mexico-U.S. Migration* ([Horowitz, 2012](#)), distributed through The University of Texas at San Antonio Mexico Center and at international conferences including the World Congress on Comparative Education (WERA) held in Istanbul, Turkey ([Horowitz, 2010](#)) and [Horowitz \(2013\)](#) discussion of realignment of language and transcultural identities (Guanajuato, Mexico).

There are many ways youth use language expressions to characterize and navigate movement across space and daily life. They use language and gesture as references-to-space to understand a problem or resolve cognitive dissonance (See Horowitz, 2021). Levinson proposes, “... different species paint mental pictures of their spatial environment using some pretty specialized sensory equipment” (2006, p. 221). In the case of humans, and youth per se, autobiographical memories, we have learned, are based in geographic locations in space and time. This includes capturing geographic space in a house, one’s block on a street, and bridges that lead to new spaces. Of late, language representing space is seen as the embodiment of language and contexts by social-psychologists and speech communication theorists, not to be ignored.

The theoretical work of Lev Vygotsky (1929/1994, 1978) highlighted the importance of culture and social context for child development, language, and literacy. This work is of great significance here for our purposes. Vygotsky’s theories about language created in social-situational contexts have led researchers across the world to look more closely at discourse patterns, functions of language in space—and, in our instance, among boundaries between nations. How adolescents use language within distinct space across a border may capture their mental attitudes and beliefs. [Saldivar \(1997\)](#) proposes a remapping of cultural studies with attention to borders.

Youth who regularly cross the United States–Mexico border

There are few scholarly studies of border crossings. Testimonial narratives, however, are surfacing from historical diaries, interviews, and surveys. Little is known about the oral and literate practices of migrant adolescent (13–19) and young adult (20–27) populations who travel across a border that would be useful for educators in developing pedagogical practices. [Gabaccia and Ruiz \(2006\)](#) report some of the largest immigrant groups across the world are from Mexico, China, and India and often, today, cross borders to return to their country of origin in order to maintain contact with family and friends. We have not found case studies that address the higher educational needs of those youth who regularly cross a border, in this instance, from the United States to Mexico—sometimes missing schooling and opportunities for advanced education or simply dropping-out of school ([Kennedy and Roudometof, 2002](#)). Some studies consider multi-lingual literacies in transnational digitally mediated contexts ([Lam and Rosario-Ramos, 2009](#)) and narratives told across borders ([Sanchez, 2007](#)). With the rise of the uses of the internet, transnational communication is rampant particularly among adolescents and youth.

A research study of Border-Hispanic Adolescents

We chose one high school to study on the United States-Mexico Border that had a reputation for serving Border-Hispanic Adolescents, successfully. While teaching at a Hispanic Serving Institution in South Texas, I interacted with our students from U.S. border towns who travel transnationally and regularly, to no end, to further their education. They helped identify the high school we studied—indicating its unique attributes in serving students who often travel to and from Mexico. The school was located two-and-one-half hours to the closest city. In 2008, based on Texas Education Association (TEA) data, 26% of the town was in poverty, with women working in education or health occupations and men largely in construction. When we first entered the school, in 2008–9, 99.9% of the students were Hispanic. There was only one Anglo among the 1591 students! At that time, the graduation rate included 83% of the students.

In 2019, ten-years later, there were only slight changes, based on Texas Education Association (TEA) data. There was a slight drop in Hispanic students, 95% of the school, with 95% economically-disadvantaged. However, we found 96% of the students had graduated, rather than 83% in 2008, an impressive increase for high school graduation—a rarity in urban schools in the U.S. where there is high secondary drop out and only 50% or more have graduated. See research by Robert Balfanz (2008) on what he terms, “U.S. high-school dropout factories.”

The high school we studied was characterized, in multiple ways, as one where youth were achieving, overcoming poverty-based struggles, and developing what Norman Garmezy, University of Minnesota (Garmezy, 1991 and personal communication) has coined as “Resilience.” There were key factors that our research team regarded as influential in the education of these high school students.

The teachers in the high school on this United States-side of the Texas-Mexico Border were residents of the neighborhood surrounding the school, and expressed, in informal interviews with this researcher, an unyielding loyalty to the adolescents, dedication to community and faith in the school. This is because they grew up as students in the very high school that we studied, many promising to “give-back” to the school in which they were raised. This school, on the border, built resilience in its students, for one, symbolized by the mascot, *El Toros*, a sculpture of a fierce bull, visible outside of the building. The students sought to use this bull and the school setting strategically, in ways that Anzaldúa characterized as a place to distinguish—“us” from “them” (1987, p. 25).

The principal of the high school was charismatic. He created an atmosphere that was energized. This principal projected a rapport with students that was captivating. We observed his greeting of students with handshakes, smiles, and verbal connectivity, particularly so, with the males in the hallways. Teachers followed his dialogue style, repeating similar acts of communication, rapport, and emotional support to connect to the adolescent students.

Rampant stereotypes of border lands and youth populations

The adolescents on the border of Texas-and-Mexico are portrayed as subject to poverty, violence through gangs, and physical or mental illnesses. This space is *not* characterized by the “Good American Life.” These negative generalizations abound on social media, news reports, and in the movie industry. From these labels, there is a perception of human deficiencies and limitations of possibilities for work and human growth. David Berliner (2017), former President of the American Educational Research Association, characterizes poverty as an unending culprit for linguistic constraints with deep learning foils. He shares how poverty is overlooked in developing educational research and practices.

Research to uncover realities of United States—Mexico border adolescent populations

The students we interviewed in a focus group, who attended the high school of interest, on the United States side of the border, faced many obstacles with trepidation often promulgated by poverty. However, what was amazing to our team was the drive and motivation that we heard for advancing learning and chosen careers. In fact, one might argue that poverty here was an impetus for sustaining achievement. An English Department Chair selected the youth we interviewed—for a focus group during the school day. At our request, they were selected because they were (a) engaged in frequent travel across the border (daily, weekly, or monthly; (b) identified as below the established poverty line; (c) were voracious readers; d) were highly verbal, based on verbal assessment data coupled with qualitative measures, and (e) willing to talk openly about their reading-life habits. We wanted to know when they read, how they read, and why they read.

A focus group was created, with four students attending the one high school and routine travelers across the Border to Mexico. Details of this study are reported in Horowitz (2012). One female student, Nava (all names have been changed), bilingual, reported travel across the border to visit her grandmother and grandfather and to eat in her favorite restaurant. She described reading profusely—from Shakespeare’s *Taming the Shrew* to the Bible daily, newspapers, and health books. Her wish was to become a pediatrician. She hoped to attend a research university in Texas. Her parents only speak and read Spanish. Another female student, Janie, described travel twice per month to Mexico. She viewed reading as central to her life. As a voracious reader, she conveyed buying “a minimum of two to three books per week” although Jamie revealed “her family frowns on it.” She described reading in a fast-food restaurant when there were no customers, hiding the book under the counter. Her joy was described as teen fiction and romance novels. She hoped to study Psychology at a four-year college. The two males in our focus group also talked about reading and their aspirations. Ed noted travel to Mexico to the Orthodontist once per month or to the beach. He preferred Manga books—Japanese graphic novels. Less sure than the females about what he will do after high school, Ed conveyed he may pursue technical work or the education field. Finally, David described travel three times per week across the border to visit his father who is a preacher of a large church. His travel was to go to *La Feria*, the fair, to buy CD’s, to shop or for less expensive medicine in Mexico. He conveyed purchasing books every week, usually fiction. He will pursue business administration until 40 and then write novels. In sum,

our focus group of high school adolescents showed strong reading interests, a commitment to distinct goals, and were articulate in English about their aspirations. As transnational travelers, these students were gaining fluency in speaking and reading English and Spanish.

Crossing from Mexico to the United States-side of the border – and returning to Mexico

Interestingly enough, a number of adolescents and youth have crossed from the U.S. only to return to live in Mexico. Research by Professor Tatyana Kleyn (2017), a Russian-born, immigrant who moved to the U.S., investigates the dilemmas these returnee youth face once living in Mexico and the psychological conflicts faced in the U.S.—resulting in a return to Mexico. In some cases, those Americans in Mexico seek to and do return to the States because they conveyed in interviews by Kleyn as seeing themselves as more “American” than “Mexican”. Surprisingly, many U.S. students living in Mexico, who returned to Mexico, arrive with their families, but have limited Spanish and cultural affiliations that will serve them well in Mexico, resulting in a return to the U.S. We have no data for educators about this population that I could locate at the time of this essay.

Part II Bedouin border life in the Negev of Israel

Another project at The University of Texas at San Antonio is in collaboration with Kaye Academic College and Dr. Doron Narkiss in Beersheba, Israel, about 20-miles from the Gaza Strip. Dr. Narkiss taught a *Seminar in Postcolonial Literature* – a course that examined minority versus majority issues of Identity and Inclusion, at Kaye Academic College, a teacher training institution. Students are international but largely Bedouins. They were asked to read Gloria Anzaldúa’s chapter (1987) “How to Tame a Wild Tongue” and respond re-telling about their own “wild tongue” story. Anzaldúa describes a trip to the dentist and the challenge of “dental (personal) extractions”, a metaphor used to describe how language of origin is often extracted, literally removed, from a people, in this case, the Spanish language is blocked. At UT-SA, we asked undergraduate Hispanic students in teacher training to read the same pages and to write about a language conflict and obstacle they too experienced in or near a border town and how it was resolved. Interestingly, they were many similar accounts of “language extractions” across these two locales, although I highlight the Israeli border accounts due to space limitations.

The largely female, future teachers at Kaye Academic College, Bedouins, Russians, Europeans, and other Israelis, live in and around Beersheba, a frontier of South Israel near Gaza, and are pursuing teaching as a career. The Bedouins, the largest local group, have been described as a “nomadic” culture. They are *not* required to serve in the Israeli Army, but many do volunteer to serve, much like the Druze of Israel; the Druze are another unique cultural group with multifaceted identities faced much like the Bedouins with constant questions of identity, citizenship, and patriotism (Nisan, 2010). To elaborate, the Bedouins in this region, like many, of United States Hispanic border populations, have ties to family outside of Israel in Gaza and cross a border for visits with relatives. Prior to 1948, Bedouins in the Negev were known as Arabs of Beersheba. In Beersheba, a city founded in 1900, where they have lived and grown. Since 1966, they engaged in livestock rearing and farming. Many live within tents or other insecure housing. They are attached to the land, living in hamlets, or Bedouin groups. Unemployment has been high, with 29% for men, and 80% unemployment for women. Some Bedouin have become more urbanized but it was noted by Kaye administration that over half of the families were in poverty and 60% of children in poverty. Border patrol with Gaza has been loose but with time more stringent in border crossings. The Bedouins cherish their land, and there has been constant struggle over land rights with the Israeli government that have been discussed by scholars and advocates of indigenous border populations (Elsana, 2021).

On my trips to Israel, and in 2017, I began developing a partnership between The University of Texas at San Antonio and Kaye Academic College in Beersheba. I visited college classrooms comprised largely of Bedouin youth from Beersheba, preparing to become educators in Israel. There were also Bedouin faculty helping to transition the students to a new mental framework that would serve them well in teaching. The women were struggling with their identity, as a Bedouin woman, and their life in a multi-cultural Israel, as an educator. While many did not travel to Gaza regularly, there were family and friends there with whom they expressed fierce loyalties and dynamic connections. Thus, one may recognize many commonalities between our Bedouin residents and our U.S. Mexico residents.

New measures for study of border populations?

What questions need to be asked about Border Populations? What measures do we use for understanding the motivations, interests, and literacy and educational aspirations of the population addressed in this chapter? Do we need new measures of individual learning within cultural-social spaces and practices that will inform instruction in classrooms (Brittain, 2009)? There are additional sources of information to acquire: (a) autobiographical and ethnographic accounts of those pursuing the teaching profession from Bedouin communities are needed; (b) historical accounts of the changes among Bedouin communities or hamlets are necessary in order to help students make a transition to current Israeli living and teaching; (c) what requires intervention is a tricky matter, as we want to respect the values and cultural practices of the Bedouin females and males alike. How do we sustain that respect? And (d) studies by comparative-education researchers are warranted. Are there specific methods for teaching that are successful with particularly first-generation college youth who cross borders—physically and psychologically world-wide? Such research is needed.

Oral testimonials of border life and authentic memory accounts of language conflicts

The Borderland research reported in this chapter used Narrative Testimonials and Memory Accounts to learn about the border language and discourse conflicts that our adolescents and college youth encountered (See Markowitsch and Welzer, 2009; Riessman, 2008). The following content themes suggest avenues for future educational research.

Hierarchical language perspectives

Anzaldúa's book chapter triggered painful thoughts expressed in writing by our immigrants in Gaza.

One female student at Kaye College highlighted a *hierarchy of attitudes* toward languages: "cultural superiority finds its way into every discourse. When Anzaldúa's teacher told her to speak American, she was telling her to think and feel American as well, and when any English speaker goes abroad and assumes that they will be speaking English, they are saying the same thing."

Another female wrote about *the metaphor of the dentist*, extractions, and non-frequently used "tongues". This becomes a metaphor, as noted by one female: "Anzaldúa uses a word game with the word 'tongue.' The word 'tongue' refers to a language dialect or pronunciations of power, and also to the tongue in our mouth. Also, in order to speak and let our voices be heard we must physically use the tongue in our mouth."

Cultural assimilation through name changes

Another female student, Russian, noted how her name was changed to an Israeli name for cultural assimilation: "I showed my drawing to the class and told everyone that my name is Katya, then the teacher asked me to stop my presentation and told me: 'Katya is not an Israeli name, from now on your name is going to be Ketty.'" And so she did to the other Russian pupils, by the end of the day we all had new Israeli names."

Still another male also wrote about name changes: "Many of the Russian and Ethiopians were also asked to change their names to more Israelis names and to work on their accent and pronunciation."

Language functions and self-perceptions of identity

A Russian male student living on the Israeli border of Gaza writes: "In this chapter [Anzaldúa] I could not but think about the question: Do we create language or does language create us? My answer to this question after reading is that language creates us. Our language is one of the things that create our identity and when we are ashamed of it we are actually ashamed of ourselves. That's why Anzaldúa writes in her book 'I am a language'".

Another student in Beersheba writes about his interpretation of the violence associated with language extractions: "After giving the dramatic and a bit violent description of the visit at the dentist, Anzaldúa in *Borderlands: La Frontera* (1987) quotes Ray Awyn Smith: "who is to say that robbing a people of its language is less violent than war" (p. 75) when right after that she starts telling her own story of struggling with the "language terrorists" who try to extinct any trace of her language and later on she shares her own and her people's "fight of pursuing the dream that one day their language will be legitimate, acceptable, approved and recognized by all."

Part III Constructing a unique teacher education for border adolescents

The border as bridge for transnational and international language and literacy

Among the various metaphors of the Border, for our purposes, *The Bridge* is the most significant and cross-culturally meaningful. As a *Bridge*, Borders allow for traveling across space, for transnational human contacts, the resolution of verbally expressed conflicts, and development of the prominence of language and literacies uses for specific societal and educational purposes. With time, as Michael Halliday noted (1973), certain language functions and styles do become prominent/necessary for the adolescent as they enter adulthood and the teaching profession. Border travel can become the valuable beginning of the adolescent living in multiple cultures, use of multiple languages, and understanding of the functions of multi-literacies— that make meaning of life, across international cultures.

Shifts in educational research and pedagogy

Teachers who serve borderland populations require a unique education and training. Jiménez et al. (2017) call for creating culturally responsive teachers of Hispanic and bilingual students learning English. This essay elaborates upon content, empathy, and teacher cognitive skills needed. Taking into account the aforementioned research, professional education and development should also include,

1. The history and current practices of the culture on the border, with its internal and external language conflicts;
2. The effective uses of bi-lingual communication in classrooms, by teachers and students;
3. The understanding of the daily and work life of the population on the border, and the obstacles given cultures face;
4. The role of family and emotional attachments to a language, literacies, and the culture of the population relevant to teaching unique border populations; and

5. The adolescent's creatively viable and distinctly "new aspirations" that influence future educators—teachers and administrators.

Such research will help inform the classroom curriculum and strategies that are used and sustained.

The recent AERA-OECD International Study of 8 countries (2021) presented by the American Educational Research Association over Zoom provides information about teaching practices in mathematics but is relevant beyond mathematics, to other disciplines of instruction. Professor Frederick K.S. Leung of the University of Hong Kong on the AERA-OECD Panel asked astute questions with an eye toward comparative education: What is good teaching that is universal? What is unique to a country? And most importantly, he has asked what is good teaching in a cultural setting? Borderlands capture more than one culture and provide avenues for advancing inter-cultural and language/discourse blending in unprecedented ways that we must address.

How do teacher-educators develop a literacy curriculum for those who cross a border, move from one nation to another? There are tremendous individual differences. In my research and that of others, we have found some border crossers prefer to preserve their first language and develop it. Others prefer continued growth in their first language with development in a second language, often English. Still another option is some individuals prefer to develop both a first and second language, recognizing that a second language may be an avenue for better work and life opportunities. These preferences are also evidenced in the literacy education, reading and writing practices. All of this makes the teacher's role a complex one. It requires knowing student backgrounds, individual needs and interests, and an ability to navigate multiple languages and literacies in cross-national contexts.

Great divides: literacy, culture and social development

The socio-cultural focus in Literacy Studies grew as a field of research in the second half of the 20th century out of conflicting views on what literacy is, including claims and counter-claims about the role and importance of reading and writing in social development, industrialization and the rise of the West. The debates that gave rise to the field took place while modernization theory was influential, which viewed Western, and particularly US American capitalism and industrialization as the model of social development for everybody else (e.g., in [Rostow, 1960](#); [McClelland, 1967](#); [Inkeles and Smith, 1974](#)). Also implicated were human capital theories linking education to economic growth ([Schultz, 1961](#); [Becker, 1964](#)). These theoretical perspectives emerging in the context of Cold War politics sought to identify key “social variables” that could be manipulated to foster development toward modernization. One of the important theoretical questions relating to literacy and language raised by this literature was whether there existed a *literacy divide* which lay at the fault-line between “developed” and “backward” parts of the world and whether it accounted for that divide, to any extent. Literacy was often closely correlated in such research with income, wealth and health at an individual and a societal level. Richer and healthier regions of the world, wealthier nation states, and individuals were seen to have higher levels of literacy than their less prosperous or healthy counterparts. It was then concluded ([Goody and Watt, 1975](#)), and, indeed, is still often concluded, explicitly or implicitly, that literacy itself was the technology that made the difference. The socio-cultural orientation to literacy studies, also known as the New Literacy Studies ([Gee, 1996](#)), grew in critical reaction to these highly generalized and teleological views on literacy and development.

The sources for such “great divide” theories of literacy and of society more generally were popularized in the mid-20th century through the writings, in particular, of anthropologist Jack Goody, social theorist Walter Ong, as well as the psychological arguments of David Olsson. Goody, Ong and Olsson all drew on historian Eric Havelock’s work on the ancient Greeks and literacy, particularly on his *Preface to Plato* ([1963](#)). According to Havelock, the Greeks of around 650–550 BC took the pictographic, ideographic and syllabic writing systems that had been under development from around 3000 BC on the part of the Egyptians, Sumerians and lastly the Phoenicians and transformed them into the alphabetical system of writing, adding letters for vowels to the consonant and syllable signs of earlier script forms. This move allowed, as he claimed, for written symbols to at last closely represent the meaningful sounds (phonemes) of (the Greek) language. He viewed this as a pivotal moment in the rise of the West, as it finally allowed language to be written down clearly and unambiguously, transforming what literacy was and what effects it had, making possible philosophy, historical study and scientific thought for the first time.

[Ong \(1982\)](#), following this example, drew a sharp division between what he called literate cultures and oral cultures. He embraced the Havelockian idea that “writing restructures consciousness” (the title of Ong’s fourth chapter) and is the very source of logic, while speech is transient and evanescent—no sooner is something said than its sounds fade away. Alphabetic writing, in contrast, he argued, provides a clear record that can be thought about and returned to, without it having changed in the interim. The effect on thought and consequently on social organization were profound, he claimed, resulting in a great divide at every level of social organization between oral and literate cultures. [Olson \(1977\)](#) similarly argued that alphabetical literacy initiates a unique and

pivotal development in human cognition, changing language from “utterance” to “text,” where the uncertainties of speech are supplanted by the precision of writing, with language increasingly able to stand as an unambiguous or autonomous representation of meaning. Goody (1975) described literacy as “the technology of the intellect” which set the human mind free from the constraints of the oral and which could only be held back (“restricted”) from fostering universal enlightenment, reason and democracy by certain distorting features of non-western societies, such as social secrecy, caste-based restrictions, rote learning of literacy in religious schools and other “oral residues in a literate culture” (Goody, 1975, 14). In Goody’s (1987) analysis, dynamic literate cultures could be distinguished from conservative oral ones, as well as from societies with what Goody called “restricted” versions of literacy (India, China and in Arab countries, for example): Such restricted literacy, where literacy activity was distorted by the dominance of pre-literate forms of social organization, did not allow literacy’s transformative social potential to do its work in producing modern, progressive and industrializing societies.

Street (1984) identified this thesis on literacy put forward by these “great divide” theorists, as he labeled them, as the “autonomous model of literacy,” due to these claims about the context-independent, or autonomous effects that literacy is said to have. He pointed out that such a sharp division between orality and literacy recycled discredited divisions that had been made in social theory between “modern” and “primitive” societies, placing western societies on the side of progress and other societies in the camp of backwardness and restriction. Indeed, these “great divide” arguments included claims that the advent of alphabetical literacy in the West had marked the move from prehistory to history; from primitive or traditional to civilized or modern societies; from pre-logical to logical and analytical thinking; from aggregative, redundant and “copious” spoken forms to abstract, concise and decontextualized uses of language.

These dichotomous and decontextualized claims by what Goody had called the “literacy thesis” might appear one-sided and biased now (and Goody later revised these claims) but their influence was and remains considerable. Take for example the importance attached to contemporary large-scale standardized literacy testing that continues to be organized, nationally and internationally, or the UNESCO “literacy league tables” still published annually, which claim to compare “literacy levels” between countries, as if something precise, reliable, generalizable and of importance is displayed in these data, something upon which societal decisions can be based—including how investments should be made in education.

Collapsing the great divide

In *Literacy in Theory and Practice* (1984) Street argued that many of the characteristics which great divide scholars attributed to “literate societies” alone were either part of the intellectual framework of any society or the outcomes of complex social processes—not simply effects of literacy in itself. He wrote that literacy was not so transparent and democratized a practice in early Greece as was being claimed. The Greek histories and philosophies were driven by sectional interest, rather than disinterested logic and clarity. The ostensibly “politically neutral” model of literacy put forward by Goody and colleagues relied upon a rhetoric of individual and social developmentalism that celebrated certain western literacy practices as universally normative. Street’s analysis of literacy joined a social analysis of power relations as well as language and literacy ideologies to an orientation to the cultural production of meaning and values in particular settings. Therefore, he argued, consequences that ensue from literacy are neither “neutral” nor effects of literacy on its own but are instead variable. They depend on the nature of the myriad literacy activities that play out in social life and are integral components of larger social practices. The “literacy bits,” Street argued, cannot be studied as if they have effects of their own, separate from the larger social “goings-on.” There were no empirical grounds for assuming an automatic, causal or universal relationship between literacy and social development of various kinds. Rather, different histories of exposure to certain ways of communicating, valuing, reading and writing yielded different forms of reading and writing as practice. The latter evolve and are enacted in contexts involving particular relations and structures of power, values and beliefs. His ideological model of literacy thus sees “literacy” as a shorthand term for practices rooted in social, cultural and political contexts, such that the relationship of writing to language and to thought was different in different contexts. Therefore, no general arguments could be made about the effects of the introduction or presence of writing.

Theories about a “great divide” between literacy and orality, and between literate and oral individuals and cultures, Street argued, reduced the rich diversity of socio-cultural life-forms to a one-dimensional scale where one version of literacy was set as the standard in an ideological and biased way. Street (1984) explained that why he called this counter-position an “ideological” rather than a “cultural model” of literacy was that “culture” had become too static a term and he wished to distinguish his approach from one that saw a world of independent one-language-one-literacy units. Using “ideological” (rather than “cultural”) signaled precisely that there are always contests over the meaning and the use of literacy practices. He saw culture “as a verb,” “an active process of meaning-making and contest over definition, including its own meaning” (Street, 1993, 25).

The origins of Street’s thoughts on literacy lay in the research that he conducted in the 1970s in North East Iran, in fruit-growing villages, especially in the village of Cheshmeh, near the city of Mashhad on the border with Afghanistan. Unlike what he read in Goody and in the arguments of UNESCO and the Iranian government, who were campaigning to remove illiteracy in the villages, Street found various literacy activities in the village, despite outside assumptions about widespread illiteracy in such environments. He saw literacy being used in commercial activities on the part of farmers and traders, in the Islamic religious center or *Maktabs* where the Koran was read and learned, and in children’s schooling. Literacy taught in schools thus turned out to be only one of the literacies that people drew on in the village, and school literacy had a less than dominant role there, because the other literacies

were part of the everyday social practices of influential villagers. The latter were not usually those who had attended school but older men who had attended the Maktab. Koranic literacy instruction is stereotyped for not providing proper literacy because it is simply memorization of passages, but Street found interesting variety and complexity instead. The texts were differently organized on the page compared to western linear writing, the writing was inserted in different forms, angles and in varying relationship with other units of text, so that students learned that reading is not just about language written down, but that organization of text also carried meaning in particular ways.

Despite the complexity of the literacy practices that Street (1984) identified in Cheshmeh, outsiders, including literacy campaigners, assumed villagers were illiterate and living in the dark; and that without the literacy of standardized instruction, they would remain cognitively, socially and culturally deficient. Street instead noted that the people in the village might well have failed tests for literacy, developed with schooling models in mind. Yet, they were using reading and writing on a regular basis in situated and locally appropriate ways. Standards for literacy were a function of local practices, and a test run by outsiders would not reflect that. "If these complex variations in literacy which were happening in one small locale were characterized by outside agencies—State education, UNESCO, literacy campaigns—as 'illiterate', might this also be the case in other situations too?" Street (2001, 6) asked, concluding that the then dominant assumptions about literacy, both in development circles and in academia, were wrong. They treated literacy as unitary—an independent variable that could be applied with predictable effects across contexts with consequences for social and economic progress, cognitive development and democracy. For example, modernization economists attempting to quantify literacy's developmental capacity had claimed that a 40% literacy level was necessary for economic take-off, and 80% for rapid industrialization (Street, 2001). Street identified the prevalence of what he called *scriptism*—a view of the influence of writing on the conceptualization of speech—a belief in the superiority in various respects of written over spoken language and the view that some uses of language are more "context-dependent" or "objective" than others. He stressed the importance of going beyond a narrow focus on provision and instruction in literacy and language research and in developmental planning. Ignoring the situated and variable nature of language and literacy practices has led to a fundamentally flawed set of assumptions about language, literacy and society in much of the developmental literature, he insisted.

Varying "ways with words"

A second strong impetus for conceptualizing literacy as variable socio-cultural practice in local settings came from Heath's (1983) widely read study of south-eastern communities in the USA. Heath (1982, 1983) questioned why Black students were failing in the recently desegregated schools in Southern Carolina and carried out ethnographic research into the literacy, language and learning in three neighboring communities. She was informed by a socio-linguistic orientation to language, particularly by Dell Hymes' approach to researching language and communication through the ethnographic study of specific speech communities. Hymes' work contrasted with Chomsky's (1975) focus on language competence as a biologically evolved capacity of humans, best studied in abstraction from social context and individual performance. Hymes, instead, emphasized the social and cultural dimensions of language, insisting that language should be studied with regard to how meaning was produced through social interaction in specific contexts, and how what counted as *communicative competence* was specific to particular speech communities. Intelligibility was for him not only a complex function of features of linguistic form (phonological, lexical, syntactic), but also of norms of interaction and conduct in conversation and in writing. He suggested that "one think of a community (or any group, or person) in terms, not of a single language, but of a repertoire," comprising a set of ways of speaking with "speech styles, on the one hand, and contexts of discourse, on the other, together with the relations of appropriateness obtaining between styles and contexts" (Hymes, 1996, 33). Membership in a speech community, he argued, consists in sharing one or more of its ways of speaking—that is, not in knowledge of a speech style (or any other purely linguistic entity, such as a language) alone, but in knowledge of appropriate use as well.

Heath (1983) shared Hymes' concern for the communicative dimensions of linguistic interaction. She wanted to understand the socio-historical context that shaped distinct communicative orientations, as well as to study how literacy was part of such communicative practices. She found that children in three socio-culturally divergent settings of the town (Roadville, Trackton and "the townspeople"), while being socialized within their local communities, were acquiring particular ways of using language and narrative in social communication which were incompatible with those of schooling in specific ways. As babies, children in Trackton (a working-class black community) were almost always held in their waking hours and were constantly in the midst of ongoing human communication, verbal and non-verbal. Adults did not engage children as conversational partners in "baby talk," where they simplify their language, as was practice among the townspeople. Trackton adults did not sit and read to children or direct questions at pre-verbal children (such as "Why are you crying?"). Adults chose verbally competent conversational partners (other adults or older children) and talked *about* the infant to them. Children were discouraged from answering the questions of outsiders and were rarely asked "What is X?" questions (Heath, 2001, 320). Instead, they were asked analogical questions which called for non-specific comparisons of one item, event, or person with another (e.g., "What's that like?") (Heath, 2001, 333). Though children could answer such questions, they rarely named the specific feature(s) which made two items or events alike. They learned to tell stories by rendering a context and inviting the audience's participation to join in the imaginative creation of a story. Children were encouraged to draw attention to themselves and to entertain by way of the display of particular kinds of associative verbal dexterity. Group negotiation and participation was a prevalent feature of the narrative performances of adults and children.

Heath reported that in school, Trackton children commonly had trouble adapting to the social interactional rules for literacy events. They did not respond well to direct questions, as there was no precedence for this interactive pattern in their home settings. Their teachers ignored their developed abilities to metaphorically link events and situations and recreate scenes. After the elementary years, when their imaginative skills and verbal dexterity could really pay off, they had often failed to gain the necessary written composition skills needed to translate their analogical skills into a channel teachers could accept.

The working-class white children in Roadville, whose families had been mill-workers in the region for several generations, were brought up into ways of knowing that were very different from those of the Trackton children, but also incompatible with the communicative forms and practices that school teachers took to be the norm. This was in spite of the abundance of reading materials in the neighborhood homes, in the form of magazines, newspapers and books. Roadville was a religiously conservative (Christian) community whose children reportedly struggled at school despite the high value attached to reading and writing. Heath traced in fine-grain ethnographic detail the communicative practices into which they were raised instead. Children were read to from books that emphasized nursery rhymes, alphabet learning and simplified bible stories. They were encouraged to find a clear moral message in each account they read or gave. They were discouraged from elaborating on accounts, giving perspectival or emotional readings, or fictionalizing real events, a practice associated with lying among parents who saw the Bible, for example, as containing literal meaning and guidance for everyday living. They were good at well-ordered practices, involving the keeping of time and space limits, and good at delivering factual recounts, as opposed to interactive and/or intertextual accounts. They struggled with the kinds of evaluative, decontextualizing and recontextualizing narrative practices valued in school, and therefore generally struggled to do well.

In contrast, Heath (1983) suggested that the way children of both White and Black “townspeople” grew up talking, communicating and relating to narrative and print in their middle-class homes matched well the practices of school and the forms that literacy took there. From an infant age the children encountered the question formats that characterize so much of school interactive discourse (those of initiation-reply-evaluation sequences, for example), labeling habits, fictionalizing practices, practices of relating book knowledge to real life experience, and such interactive behavior as learning to listen and wait in response to particular cues from their parents and carers. They learned patterns of interaction in relation to texts which prepared them for those of schooling. They were encouraged to take up positions in relation to the texts they were responding to, to present “accounts” rather than “recounts.”

Heath concluded that what counted in effective communication was not a generalized competence (e.g., being able to “speak English” or “code and decode letters”) but a situated, communicative competence embedded in acquired, “deep” cultural knowledge and learned models of using language and making meaning in specific ways. Heath’s work made the same case as Street that there are multiple ways of taking and making meaning in reading and writing practices. The selection of but one way as normative in school and in formal institutions, meant that people whose ways were different from the norm had to continuously struggle to adapt to that standard. She criticized the “great divide” distinction between literacy and orality because it placed undue importance on the medium of communication at the expense of its social purpose.

Heath (1983, 2001) suggested that teachers should learn more about the communicative practices and traditions that children from different socio-cultural, linguistic and socio-economic backgrounds brought to school contexts, and to treat children’s language and social behavior as manifestations of the rules of communicative competence they had acquired successfully in their communities. She argued that dichotomization between oral and literate traditions was “a construct of researchers, not an accurate portrayal of reality across cultures” (Heath, 2001, 339). Her study instead showed the culturally diverse ways of acquiring knowledge and developing cognitive styles. Trackton and Roadville children were “disabled” in the schooling context not because of any general, individualized cognitive deficit but because their practices of everyday life had initiated them into differing sets of expectations regarding intimates, non-intimates, and how they relate to one another—in speech acts as well as in reading and writing activities.

Literacy within socially organized practices

A third influence on the socio-cultural, or social practices model of literacy was Sylvia Scribner and Michael Cole’s ground-breaking research (1978; 1981) of literacy and cognition in Liberia, West Africa which found that cognitive skills associated with literacy varied dramatically in relation to the wider social practices within which literacy was embedded.

Scribner and Cole were among the co-editors of the influential English language version of Vygotsky’s *Mind in society: The development of higher psychological processes* (Vygotsky, 1978). Concerned to elaborate on the social dimensions of cognition, they drew on Vygotsky’s claims that interpersonal/inter-mental (or social) processes are the necessary condition for the emergence of individual/intra-mental (psychological) processes. Luria (1979), a contemporary and colleague of Vygotsky, had carried out a study of the cognitive effects of literacy acquisition by running tests among persons living in remote parts of Uzbekistan in Central Asia, some of whom had learned to read and write and some who had not. Luria reported significant differences in response to tests of cognitive processes across the two samples and concluded that these differences were a direct outcome of whether or not the research subjects had learned to read and write.

Luria did not, however, distinguish between the cognitive effects of literacy and other possible causes of cognitive change, such as participation in schooling practices. Scribner and Cole (1981), in contrast, were concerned to distinguish between the effects of literacy as distinct from the effects of schooling and other social practices. Their research team studied in detail the cognitive and social consequences of literacy in a different setting—Liberia—where three different scripts and literacy traditions were present:

school literacy in English, a religious literacy in Arabic script and an indigenous script used by individuals for letter writing and record keeping in the local language. Some of the local Vai people were able to read and write in one, some in two of these scripts, and some were unable to read or write in any of them.

Over a period of 4 years and extended follow-up work, Scribner and Cole, with research assistants, gathered ethnographic and survey-based descriptions of language and literacy use and also ran a battery of tests of Vai persons' cognitive, perceptual and conceptual processes, including tests for abstraction, memorization, categorization and verbal explanation skills, so as to study the uses and consequences of literacy in these three different scripts, languages and contexts. They were able to distinguish in their analysis between "literacy effects" and "school effects," and showed that the cognitive attributes previously associated with literacy (by Luria and others) were not products of literacy itself but variable outcomes of particular social practices like schooling or urban living.

The failure of literacy to yield consistent cognitive effects across all three scripts and literacies (and the inconsistency of schooling effects on measured cognitive outcomes) led Scribner and Cole to conclude that "schooling and literacy are not synonymous" and that "literacies are in fact highly differentiated" (1981: 132). This made them question the tendency by many writers to "discuss literacy and its social and psychological implications as though literacy entails the same knowledge and skills whenever [and wherever] people read and write" (1981: 132). They found that cognitive skills associated with literacy varied dramatically depending on whether people's literacy experiences were school, religious or community activities. Scribner and Cole made the case that there was nothing special about literacy in general as regards its consequences for cognitive skills. Rather, as had been argued by Vygotsky (1978), cognitive processes had a direct basis in socio-cultural activity.

They thus challenged "great divide" claims that literacy acquisition produced certain cognitive changes, regardless of the context of learning. They made the important argument that literacy is not a general technology that is the same thing with the same consequences regardless of what the contexts of its acquisition might be. Instead, they claimed that literacy was always constituted within socially organized practices.

Methodologies and research constructs

Gee (1999, 1996, 2003) provided detailed examples of what literacy and language looked like from a discourse-oriented socio-cultural perspective. His examples show that an interpretation of any utterance or text always involves an interplay of linguistic, semiotic and social frames of interpretation. The sources of meanings in a text then don't lie in the word itself but in the social matrix within which a piece of writing is produced and understood. He made clear that reading involves the making of meaning with available resources, and such meaning is not made or taken mechanically one word at a time, but rather with a sense of contextual specificity drawn from the wider text and context that is being produced, invoked or interpreted.

Take something so simple as the following sentence: "The guard dribbled down court, held up two fingers, and passed to the open man" (Gee, 2003, 29). While one might seem to know every word in the sentence, you can't make sense of the piece without knowing in detail about basketball as a game, that is, as a particular sort of social practice. Gee showed that the same applies to any sentence or text. Gee's point is that what is important in understanding and meaning-making is not words (oral or written) themselves, but the larger and specific sociocultural coordinations in which they gain their significance.

Key terms in the study of literacy as situated, socio-cultural practice have been "literacy event" and "literacy practices." Literacy events are moments when "written language is integral to the nature of participants' interactions and their interpretive processes and strategies" (Heath, 1982, 93) and literacy practices are the more general sociocultural framing that gives significance to particular acts. Literacy events, in Heath's conception, included those moments when inscription or decoding of text is featured—but not necessarily centrally. Central was instead the configuration of action, talk and text in multiple and socially varying ways. "Events are observable episodes which arise from practices and are shaped by them. The notion of events stresses the situated nature of literacy, that it always exists in a social context" (Barton et al., 2000, 8).

The concept of literacy practices incorporates literacy events as empirical occasions to which literacy is integral and analyses them in terms of the models or preconceptions that make people decide who does what, where and when, as far as reading and writing is concerned. Epistemologically, the concept of literacy as a social practice provides the frame for an analysis of meaning making. Methodologically, the approach has been grounded in linguistic ethnography and has drawn on discourse analysis, socio-cultural models of cognition and various strands of sociolinguistics and social theory for its analytical work. Widely referred to as The New Literacy Studies (Gee, 1996) the approach has influenced at least four generations of researchers (Baynham and Prinsloo, 2009). Typically, researchers have observed or recorded particular literacy events at their site of research and then tried to understand the wider discursive framings and social practices that produce such events in their particular form and shape. This "eventness" as a feature of literacy practices has partially been disturbed by later work, however, which has questioned its application to translocally-networked writing activities such as online, digital or virtual, literacy-linked communicative activity and other kinds of electronically enabled social activity. The construct of practices has similarly received critical attention for being so all-encompassing that it lacks analytical precision as it is referring to both routinized social activities as well as reflexive adaptations, revisions and meshings of such routines and genres (Baynham and Prinsloo, 2009).

Second phase socio-cultural studies of literacy

The criticisms of “great divide” theories of literacy in these early shaping studies described above, and in their development of an alternative focus on literacy as variable social practice, were supported by detailed research studies that accompanied and followed them, from various parts of the world. Such research included localized ethnographic studies, many of them of non-Western, non-middle-class communities and localities, as in [Scollon and Scollon \(1981\)](#), [Finnegan \(1977\)](#), [Kulick and Stroud \(1993\)](#), [Besnier \(1995\)](#), [Prinsloo and Breier \(1996\)](#), and [Barton and Hamilton \(1998\)](#), among others. Besnier described how letter writing among a group of South-Pacific islanders was culturally marked out as a genre resource for communicating intense and effusive emotional regard for often distant relatives, friends and intimates whereas such displays were not culturally appropriate in face-to-face spoken communication. Kulick and Stroud described how engagements with literacy in a Papua New Guinea village were shaped by the high social value given to humility and “indirectness” in communication over explicitness, resulting in various kinds of novel uses for literacy. These uses would appear as unusual or perplexing to those without insider knowledge of how meanings were constructed from indirect clues as to the intent of individual writers, rather than from explicit statements. In both cases the established literacy practices of these communities contradicted the views of literacy as a “technology of the intellect,” in [Goody’s \(1975, 1\)](#) words, that operated as a culturally-neutral and transparent conduit of meaning and was displayed, at its best, in essay form, where the values of “clarity, brevity and sincerity” held sway ([Scollon and Scollon, 1981](#)).

Taking a similar, localized, ethnographic research approach, [Barton and Hamilton \(1998\)](#) observed community members in Lancaster, England and asked them to reflect on their literacy practices. Echoing Heath’s work, they showed that as important as family practices are for children’s literacy development, these practices take place in larger community contexts that influence family activities. The researchers drew a distinction between dominant (institutionalized) and vernacular (self-generated, everyday) literacies. Vernacular knowledge was seen to be local, procedural and minutely detailed. Literacy was not an explicit focus of everyday activities but literacy elements were implicit in most activities and were used to get things done, including the learning of a martial art, paying the bills, organizing a musical event or finding out about local news. When questioned about them, people did not always regard their vernacular literacies as real reading or real writing as they were embedded in other activities, like shopping, writing to a relative, paying an invoice or applying for something. They therefore did not carry the same status as more conventionally recognized literacy activities like the reading of literature or “school literacy” activity. Indeed, some vernacular literacies were deliberately hidden, because they were private or oppositional, including secret notes and love letters, comics and fanzines. The researchers concluded that much talk in everyday life that they studied was in fact talk about texts or shaped by documents or textual practices and that reading, writing and writing artifacts were very much part of the “glue” of social life in these communities.

These and similar studies gave evidence of cross-cultural differences with regard to uses of literacy and also showed that reading and writing differed across different activities and contexts among the same groups of people. Even within the same site, at work or at the home, there can also be different meanings of reading, writing and literacy, because people participate in a range of contexts, or textually mediated social worlds, within that setting, that assume differing forms of social interaction.

Local literacies

In the wider research, such cross-cultural differences were made visible across various institutional contexts, including schools, workplaces, religious settings, prisons, and in a range of home, community and leisure contexts:

Schools

As regards literacy in educational settings, influenced by the earlier work, a wider number of studies examined the ways of being, knowing, valuing, acting, speaking and attitudes to writing that children developed in their home and other out-of-school environments and which met up with the discourses and practices of schooling ([Street and Street, 1991](#); [Cook-Gumperz, 2006](#); [Gee, 1996](#); [Dyson, 1993](#); [Freebody and Welch, 1993](#); [Wagner, 1993](#); [Maybin, 1994](#); [Street, 1995](#); [Gregory, 1996](#); [Lankshear, 1997](#), among many others). Drawing variously on Bakhtin, Bourdieu, Vygotsky, Hymes, Giddens and other social theorists, they pointed to the significant variety and cultural specificity of the early literacy practices of children across different social contexts. Those studies also showed that the ways meaning was shaped through text in school settings was more compatible with the way some children had learned to make meaning, and less compatible with the “ways of knowing” of children from other backgrounds. Schooling was also producing a narrow and rigid definition of literacy as severed from social dialog, and as a “decontextualized knowledge validated through text performances,” ([Cook-Gumperz, 2006, 27](#)). Schools and adult literacy classes taught literacy as a skill which was primarily about coding and de-coding rather than teaching how to construct meaning through texts in those particular ways that were favored in schooling and other educational settings. Another central finding was that misinterpretations of what children were doing and misrecognition of what communicative resources they were bringing to schooling, on the part of administrators and teachers, tended to happen with reference to models of cultural deficit, where differences in children’s ways were then automatically understood as lacks or absences.

Universities

A further direction of work developed under the rubric of “academic literacies” in university and tertiary education contexts (e.g., Ivanic, 1998; Lea and Street, 1998; Canagarajah, 2002; Lillis, 2003, 2006; Thesen and van Pletzen, 2006; Jacobs, 2010). These scholars drew attention to power relations and identity processes around student writing in relation to institutional practices, highlighted the diversity of writing practices and genres across disciplines and recognized that students bring their histories, identifications, resources and commitments to writing. The academic literacies approach sees writing and text production as socially situated practices and activities of diverse kinds and looks at extending the range of semiotic resources—linguistic, rhetorical and technological—that are allowed and valued in contemporary universities. This orientation sees that the complexities shaping writing as an activity can be productively engaged with by university teachers rather than having them treat particular examples of student writing as evidence of some lack or deficiency. It also shows university practices to be malleable as they can be reshaped to include and capitalize on the particularities of local and regional contexts and the differences that students bring to institutions of higher learning.

Workplaces and adult-learning

Looking at workplace settings, other Literacy Studies researchers showed that workplace skills, including print-related skills, develop and flourish or remain undeveloped, as a result of social rather than purely technical processes (Gee et al., 1996; Farrell, 1997, 1999; Scheeres, 2007; Scholtz and Prinsloo, 2001). Learning is structured and defined by social relations and social practices taking place on shop floors, training sites, and other work contexts, whereas “stand-alone” literacy classes that focused on coding and reading skills remained disconnected from the actual uses of reading and writing in work settings. Researchers showed that work-related literacy practices, for both low-level and high-level workers, required them to draw on repertoires of situated ways of using reading, writing, language and other semiotic resources in order to carry out a work-related activity. Hull (1997) noted in a list of observed “literacy functions” in factory settings, that very few fell into the category of “basic” (i.e., relatively simple self-contained tasks like copying, labeling, keyboarding, tallying). The continuum of literacy that can be observed expands to include categories in which the purposes of literacy are first more complex—using literacy to explain, taking part in discourse around texts, participating in the flow of information, problem solving—and then also more obviously connected with issues of power—using literacy in the exercise of critical judgment, using literacy to acknowledge, exercise or resist authority.

Prinsloo and Breier (1996) in several studies in South Africa on the social uses of literacy in situated community and work settings, found that the literacy taught in adult education classes that they observed was not related to the literacy practices that people engaged with outside of the classes. Accordingly, they questioned the value of a pedagogy which focused on the transfer of disembodied coding and decoding skills. The adult literacy night schools were seen to promote school-like pedagogical practices which were both new to the adult learners (since they had little experience of schooling) and had little connection to the actual literacy activities in their lives.

Prison, religion

Wilson’s (2000) study of literacy in prisons similarly made the case that literacies were multiple and context-dependent. Literacy/ies in prison could not be comprehensively studied without taking into account the social circumstances of which they were a part. Her findings pushed toward a more contextualized and situated view of multiple literacies and away from prescriptive instructional models, such as the “school” perspective, the “training” perspective or the “standards” perspective. She identified various distinct literacy activities that inmates were regularly engaging in, for example frequent signature writing, official bureaucracy on reception into and release from the jail, graffiti, letters to family and friends, subversive notes to acquaintances in the jail, reading court depositions, reading official prison documentation, commissary forms, complaints forms, visits requests, tattoos, appeals, poetry, educational pursuit, books and magazines.

Kapizske (1995) studied the textual politics and practices of a 7th day Adventist community in North Australia, focusing on processes of theological (church), familial (home) and educational (school) normalization of community members into regulated ways of hearing and speaking, reading and writing, being and believing, which constructed and constrained what could and could not be articulated and enacted by believers. Once again, the “literacy bits” could not be sensibly studied or made sense of separately from the larger social “goings-on” in which they were embedded.

Examples from a wider literature that accompanied and followed these studies include Papen’s (2005) study of tourism, governmentality and literacy in Namibia; Robinson-Pant’s (2001) account of literacy and development among women in Nepal which focuses on the processes by which women in Nepal acquire literacy and deploy its use for their own purposes; Kalman’s (1999) study of mediated literacy practices in Mexico City; Maddox and Esposito’s (2012) research around literacy inequalities and social distance in Nepal; Achen and Openjuru’s (2012) research on language and literacy as globalized practices in the poorer residential areas of Kampala, Uganda; Pahl and Rowsell’s application of these insights to classroom work (2012); Kell’s (2008) study of literacy and housing disputes near Cape Town; and Prinsloo and Stein’s studies of early literacy in homes and schools in Cape Town and Gauteng, South Africa (Stein and Slonimsky, 2006; Stein and Mamabalo, 2005; Prinsloo and Stein, 2004; Prinsloo, 2004).

These studies, show, among other things, that people labeled “illiterate” within older models of literacy may, from a more culturally sensitive viewpoint, be seen to make significant use of literacy practices for specific purposes and in specific contexts. Accordingly, the boundary between literate/non literate is less obvious than individual “measures” of literacy and testing might suggest.

Unsettling the local: mobility, migration, multilingualism

Though it is not a new phenomenon by any means, migration or the movement of people between regions and localities has attracted considerable attention since the 1980s due to social, technological, and geopolitical developments around “globalization” phenomena. People and literacy resources, along with languages and other semiotic resources are more frequently seen as border-crossing phenomena than in the past, signaled by the visibility of large-scale migrations and the increasingly multi-ethnic and multilingual nature of urban communities in major centers around the world. Such mobilities contributed to raising the question of literacy in relation to language and particularly to multilingualism that was taken up in a number of early studies and has become a topic of growing importance and attention.

Baynham (1995) examined the way that Moroccan migrants in London shifted between the communicative modes of text and talk in social interaction among each other, while assisting each other with language and literacy challenges. Bilingual talk around monolingual text in school and community settings is, indeed, characteristic of most multilingual social contexts, as was seen in Gregory and Williams (2000), a study of literacy based on long term ethnographic engagement within the Bangladeshi settlement in East London, UK. Martin-Jones and Jones (2000) presented multiple studies of ways in which languages and literacies shaped, and at times perpetuated, asymmetrical power relations, especially between minority language groups and dominant language and literacy practices for migrants in host countries. The studies ranged from local life worlds to formal education and from community based to institutionalized literacy practices, providing systematic descriptions of literacy and language practices across local language groups in schools, institutional and bureaucratic settings, homes and local communities. The authors called these practices multilingual, rather than bilingual, to draw attention to the multiple social languages and the range of repertoires, communicative purposes, paths, and ways in which people acquired and developed literacies in these settings. While these studies often centered around the experiences of migrants, they retained a territorialized focus on local communities. But the heightening awareness of movement inevitably raised questions for the local character of studies of literacy as socio-cultural practices.

Importantly, in earlier days both Street and Hymes had already strongly rejected a notion of discrete cultural communities with stable languages and literacies. They were highly critical of “a ‘Herderian’ conception, from 19th Century Europe, of the world as composed of individual language-and-culture units” (Hymes, 1974, 59). Street’s study of village literacies in Iran was indeed provoked by an awareness of the tensions produced by the interface of more localized and everyday literacies, on the one hand and national and more bureaucratized literacies, on the other. So criticisms of an excessively local focus in earlier socio-cultural studies can certainly be overstated, but they did help in drawing more widespread attention to fluid and changing ways with texts and language. Brandt and Clinton (2002) for example, in a paper titled “The Limits of the Local,” criticized the “local-community” focus in earlier literacy studies. Baynham and Prinsloo argued for considering “the transcontextualized and transcontextualizing potentials of literacy” (Baynham and Prinsloo, 2009, 4), suggesting that researchers focus on locally situated literacy and language practices “with a sense of how remote sites and remote literate practices shape and constrain local literacy practices,” but also of how wider practices and routines were expressed and refigured in more local contexts. Blommaert (2010, 2008) and Kell (2015, 2011) discussed processes of recontextualization where texts move out of settings of situated practices into broader, more bureaucratic or formalized settings, with particular and varying effects. Warriner (2007), Lam and Warriner (2012), and North (2018) among others examined the transnational nature of migrant workers’ lives and the complex ways in which literacy is threaded through their social and material practices.

These studies point to a more complex conceptualization of context and of the relationship between the local and less-local (or global) within literacy research. Such re-conceptualization draws on Massey’s (2005) idea of context as both locally and socially produced and simultaneously and complexly connected, involving processes of cultural production shaped by social actors from disparate locations and where standardized practices from larger and more bureaucratic spheres encounter localized social practices that reshape these more global forms. In socio- and applied linguistics language is being rethought of more as social, material and multimodal practices (Heller, 2007) and not just as sets of disembodied “linguistic resources.” This development draws inspiration from the way that literacy has been rethought as practices since the 1980s.

Krause and Prinsloo (Krause and Prinsloo, 2016; Prinsloo and Krause, 2019; Krause, 2021) examine the notion of fluid languaging in classroom talk that is neither Standard English nor Standard Xhosa—the two official languages formally expected in the primary school in Khayelitsha, the biggest black township in Cape Town, South Africa. Here, everyday languaging practices are heterogeneous and often fluid. Speakers assemble linguistic resources without restrictions by the limits of one or more named language. Despite their fluid linguistic skills, purified, standardized Xhosa or English is mostly not a comfortable element in their repertoire and is not a local community resource in Khayelitsha. Because their fluid urban languaging resourcefulness does not help students when they encounter writing practices through standard monolingual English, they are at a disadvantage when they test for all their subjects in Standard English examinations. Teachers in turn are under pressure from the Education Department to produce high pass rates and adopt strategies to help students by coaching them on the specifics of the test. The arrival of this centrally distributed paper at the school thus induces a series of creative, localized re-shaping processes, involving translating and exam practice activities, aimed at making it (barely) manageable for most learners to pass and by extension to not get their teachers into trouble with educational authorities, who do not see the linguistic complexities they have to handle in their classrooms.

Studies like these manage to show how language and literacy practices are always nested within other socio-cultural and material practices, some new and some old, forming a nexus of practices (Scollon and Scollon, 2007), a configuration or assemblage of tools and actions with various conventions and histories associated with them which come together to form recognizable sequences of actions. To facilitate the study of such complex nexuses or assemblages, much methodological and conceptual work is under way. One innovative idea has been what Bartlett and Vavrus (2014) called a “vertical case study approach.” In this approach, a localized focus is replaced or accompanied by attention to the wider activities, practices and “goings-on” that shape the local. It still remains, however, a socio-cultural approach, committed to understanding literacy and language practices, and the social policies which shape them in institutions like schools, as “a deeply political process of cultural production engaged in and shaped by social actors in disparate locations who exert incongruent amounts of influence” (Bartlett and Vavrus, 2014: 132). It involves a translocal methodology that rejects the selection of clearly bounded research and treats aspects of school literacy practices that are shaped by wider socio-political dynamics, including the activities of curriculum boards, examination units and other units, as sites of shifting cultural production by actors through social practices.

The turn to multiple modalities and digital literacies

Under conditions of increasing online writing practices since the later 1980s researchers began to note how (sometimes moving) images and sound accompanied written texts to a degree seldom focused on before. Multimodality became a central topic in Literacy Studies from the 1990s, shaped, firstly, by Gunther Kress’s work. As Gee (2001) described it, distinct sites of social practice or “semiotic domains,” as he named them, including first person-shooter-video games, advertising, cellular biology, midwifery and surgery incorporated multiple modalities (e.g., oral or written languages, images, equations, symbols, sounds, gestures, graphs, artifacts, and so forth) to communicate distinctive types of messages. Multimodal, trans-semiotic literacy and language studies have grown exponentially since. For want of space and because they are dealt with in detail elsewhere in this Encyclopedia, we will move on here (but see also Prinsloo and Baynham, 2013, vol. 3 for a selection from the digital literacies literature).

Posthumanism, materiality and networks of literacy

Among the most recent developments in the socio-cultural study of literacy have been the influences of “new materialism” and post-humanist studies. We do not have space to discuss this new direction in detail here and it is covered elsewhere in this Encyclopedia. So we will limit our remarks here to some points about how these new directions relate to and contrast with earlier literacy studies research. In brief, these new directions are responses to what have been identified as further “great divides” to those of literacy/orality, literate culture/oral culture, as analyzed and deconstructed in the earlier days of the socio-cultural approach to the study of literacy (Street, 1984). Latour (2005) identified these further and perhaps deeper divides as those between nature and society, between human and non-human and between knowledge and being. Questioning the validity of these long-held dualisms, contemporary research that draws on posthumanist and new materialist theorizations attempts to undo related divides, between meaning and materiality, macro and micro, social and technical, along with nature and culture (Law, 2009, 147). To point to some research examples:

Leander and Boldt (2013) follow a 10-year-old boy through one day as he engages in reading and playing with text from Japanese manga, focusing on the sensations and movements of the body in the moment-by-moment unfolding or emergence of activity. This nonrepresentational approach describes literacy-related activity not as projected toward some textual end point but as living its life in the ongoing present, forming relations and connections across signs, objects, and bodies. They see such activity as saturated with affect and emotion and contrast the child’s animated literacy-filled play with his disinterested underperformance in school literacy, where his engagement is not invoked. Leander and Burris (2020) are concerned how human lives are entwined with computers and computational systems. They quote a study of student reading and how integral algorithms are to modern texts and to constructing readers: “What we read and how we read, and, more importantly, how we are conditioned to imagine ourselves as readers, is increasing determined by algorithms that operate underneath of the surface of texts.” They invoke the image of a world where “technologies are active agents, recruiting and enrolling humans and where subjectivity and agency are not merely given in advance, but are relational achievements involving people and things.”

Lindgren (2019, 6) examines children’s learning and development by “paying attention to the myriad of relationships going on between children, materials and environments in preschool.” She finds that children constantly seem to be preoccupied with establishing relationships with their environment, as well with other people, with books, pens, paints, clay, water and paper. She describes children as emergent in a relational field, where non-human forces are equally at play in constituting children’s becomings and for her “the child figures as the embodiment of flexibility and transformation through its multiple becomings with the world.” Similarly, Hackett and Somerville (2017) focus on literacy, bodies and materiality, focusing on how children engage with text on a sensual level, foregrounding “non-representational aspects of language and communication.” They focus on movement and sound in their study “as more-than-human practices through which the world forms itself, and young children’s sounding and movement happen in relation to this” (2017, 377).

Young children's literacies are seen not only as embodied sensory experiences but embedded in and inseparable from their entanglement with the world. Zapata et al. (2018) start from the perspective that knowing, being, becoming, and doing are co-constituted in a world of lively relations between humans and nonhumans. They focus on (a) writing as intra-activity; (b) writing as trans-corporeal, porous, and lively; and (c) writing as translanguaging assemblages of humans and non-humans, attending to "the entanglements of writing and its multiple productions rather than focusing on human pursuits alone" (2018, 479). They see this rethinking of writing as a matter of ethics, recasting subjectivities, where the "subject does not exist ahead of or outside language [and materials] but is a dynamic, unstable effect of language/discourse and cultural practice."

These studies describe themselves as being energized by the ethical orientation at the heart of the materialist shift. But in the work done so far ethics comes to replace socio-cultural and political analysis, with a result that the politics involved get obscured. This is a worry that Kuby and Rowsell (2017, 288) encounter in responses to their work: "What about power?" or "What about social justice and issues of race and/or economic inequities?" They respond by seeing "much hopefulness in posthumanism and are energized by the ethical orientation at the heart of this work." But how such an individualized and voluntaristic ethics deals with complex political concerns is an unanswered question.

The problem here seems to be that the focus on human/material loses sight of the diversity of humans and their situatedness with regard to the phenomena in question. The reappraisal of matter intended by the new materialism and post-humanism aims to provide a different account of agency and ontology, that fundamentally affects socio-cultural and political categories and concepts. But, in its application, if it loses its hold and attention to situated socio-cultural and political specificity, it loses a very important edge. While laudably critical of the anthropocentrism of preceding approaches, the human-material focus also needs to ask how *particular versions of the human* come into being within phenomena, rather than assuming a generic construct of "the human" in sensuous engagement with vibrant material. It needs to continue asking questions about causes and consequences of socio-economic and political inequalities, questions about the making of humanity as a category of practice—across lines of race, coloniality, migrants and borders, gender, class, commodification and place, to name just some forms of boundary-making and discrimination, attention to which is at risk of being lost, at least in the first wave of posthumanist research. The Literacy Studies focus on situated socio-cultural practices points to a route back to those concerns.

Introduction

Scholars and educators have shifted conversations regarding the teaching of the language arts over the last four decades. Conversations had predominately been about “best practices,” what was the most efficient way to teach the skills of reading, writing, and using language. Increasingly, they now focus on how curriculum, instruction, assessment, and the everyday lives of teachers and students in language arts classrooms might be defined. Defining has not been a simple matter of working toward a definition, but rather the conversations are perhaps best characterized as centered around a series of tensions that continuously evolve.

A review of language arts curricula in primary and secondary grades across countries shows the field is mostly organized into the areas of reading, writing, speaking, and listening (e.g., in the US, the [Common Core State Standards Initiative, 2022](#); in South Africa, the [Curriculum and Assessment Policy Statement Standards, 2022](#)). Reading and writing are commonly defined as literacy skills. *Language* is understood as speaking and writing the dominant variety of the language using “correct” grammar. *Schooling* is defined as institutional spaces for educating children in the language arts, among other subjects. Debates among educational researchers and educators have focused on what constitutes these literacy and language skills and how best to school students in these skills (e.g., [Neuman and Dickinson, 2001](#)). It is within this framework that the constructs of scope and sequence for acquiring reading skills, writing skills, and language “correctness” are derived, as well as best instructional and assessment practices. So widespread and taken-for-granted in education policy, practice, and research are these conceptions of literacy, language, and schooling, that alternative conceptions are marginalized, if considered at all.

Inherent to this view of literacy and language learning are the binaries of success/failure and educable/ineducable. These, and similar binaries, promulgate deficit theories of learning to read, write and be schooled; a child either masters the target skills given appropriate instruction or by definition there exists a deficit. When difficulties in acquiring target skills are manifest by large numbers of children within a particular racial, cultural, linguistic, socio-economic, or neurodiverse group, the difficulties are seen by some educators and educational researchers as indications of deficits produced by characteristics inherent to that group (for further discussion see [Dudley-Marling, 2007](#); [Smitherman, 2015](#)).

Definitions of literacy and language in schooling contribute to the production of social identities including racially inscribed identities. For example, consider an instructional conversation captured by [Piestrup \(1973, pp. 54–55\)](#) in which a first grade African-American student has been asked to orally read a sentence and is repeatedly interrupted by the teacher.

Child 1: “Dey,
Teacher: Get your finger out of your mouth
Child: “Call ...
Teacher: Start again.
Child: “Dey call, “What i’ it? What is it?”
Teacher: What’s this word?
Child 2: Dey
Child 1: Dat
Child 3: Dey

Child 4: (Laughs)

Child 1: Dey

Teacher: Look at my tongue. They.

Child 1: "They"

Teacher: "They." Look at my tongue (Between her teeth).

Child 1: They

Teacher: That's right. Say it again.

Child 1: They

Teacher: "They." OK. Pretty good,

The child, who is a speaker of African American language (also called Black language, African-American English, Ebonics, among other labels), is confused and seemingly so are other children in the class. Using the phonemic system of his native language, he is pronouncing the word correctly and both he and the teacher recognize what the word is that he is orally reading. The teacher's correction has the effect of telling him that he is wrong when he has rightly identified the word, perhaps resulting in the child's questioning of himself and his competence to read and understand. There is also a subtle but powerful message that the way that he, his family, and his community speak is wrong.

This brief classroom episode of orally rendering a word reveals powerful schooling processes that create a "person" whose language, culture, family, and community are constructed in "deficit." This view of reading, as the ability to pronounce words in isolation, arranges people hierarchically along a scale of good to bad readers and simultaneously along a scale of people who do or do not speak a language that is acceptable in school. These hierarchies apply not just to the child, but to the communities from which they come. It is not the teacher alone who is implicated in such constructions of personhood, so too are governmental policies about how to teach reading, reading programs and assessments produced by large corporations, and supervisory observations of teachers that surveil their adherence to a school district's policies for teaching reading.

As the example and discussion above show, definitions of language, literacy, and schooling have consequences for children, teachers, communities, and what happens in classrooms. Here, we focus on three tensions in how language, literacy, and schooling have been defined.

1. The tension between defining literacy and language as decontextualized, autonomous, cognitive skills and defining literacy and language as ideologically inscribed social processes;
2. The tension between a view of language as bounded, codified and socially stratified and a view of language as fluid and variable in relation to social purpose and context.
3. The tension between defining epistemology in the language arts as autonomous, given and fixed, and defining knowledge as social constructions grounded in the material realities of the everyday worlds in which people live.

As prelude to our discussion of these tensions, we offer these four caveats: first, these tensions do not get resolved through empirical sciences per se nor through compromise, but rather, evolve through dialog; second, describing a definitional issue as a tension is not to imply that there is equal weight of warranted, evidenced, or ethical argumentation or legitimacy on both sides of the tension; third, power relations limit what can be said, who can participate, and what arguments can be made and are pervasive; and fourth, both we and the field more generally, struggle in discussing these tensions because of a lack of a shared language adequate to the task of unpacking.

On the tension between defining literacy as autonomous skills and defining literacy as social processes and ideological

Beginning prominently in the 1950s, the initial teaching of reading became overtly politically controversial (Allington, 2002; Larson, 2007) with some right-wing political leaders and pundits making specious arguments connecting particular definitions of reading and reading research with encouraging the undermining of Western culture and encouraging communism (e.g., Schlafly, 1997). Conversations about how to teach reading moved from the domain of educators and educational researchers to the broader public, mass media, pundits, and politicians. The political attacks and debates on the teaching of reading, literature, and the language arts by conservative groups were taken up by elected politicians who implemented government policies aligned with those conservative positions most notably by defining how reading could be taught and what research would be funded. In brief, the advocacy for direct phonics instruction, the teaching of "correct" grammar, and a restricted canon of literature for P-12 education was and is part of a broader culture war, an ideological battle that implicates government as well as the education, literacy and language research communities (for further discussion see Pearson, 2004).

Definitional contrasts between autonomous and ideological literacy

Street (1984) has labeled the view of reading, writing, and language use as skills as an autonomous model, which posits literacy (reading and writing) as a "neutral," context-independent technology that requires the acquisition of "universal" skills. Within the context of schooling, the autonomous model defines the teaching of literacy as the teaching of decontextualized skills (e.g.,

the teaching of decoding phonic skills) assessed atomistically, and the evaluation of learners in terms of their acquisition of the list of targeted skills. An autonomous model of literacy also continues to dominate educational research.

The autonomous model can be contrasted with what Street (1984) has labeled an ideological model of literacy. Street argued that all models of literacy are ideological, including autonomous models (despite their proponents' claim that autonomous models were universal and not ideological). An ideological model of literacy defines literacy as social processes involving written language that vary in relation to social and cultural situations and contexts. An ideological model of literacy recognizes that students acquire particular shared ways of using written language from their participation in their social and cultural lives at home, in their communities, and in school. These contextualized and situated ways of using written language can be called literacy practices (social practices involving the non-trivial use of written language, Street, 2000). Literacy practices can be understood as shared ways of using written language for engaging in recognizable types of social events that are materially bounded and enacted. As students and teacher come together in a literacy event such as a reading lesson, they do not enact an idealized literacy practice *per se*; rather, literacy practices get refracted. That is, the students and teacher bring to the classroom event their experiences and understanding of pertinent shared literacy practices and then together revise, modify, change, and transform those literacy practices (For further discussion of literacy practices see Street, 1995; Baynham and Prinsloo, 2009).

Consider the classroom event described earlier in which the teacher "corrects" a student's oral reading of "they" as "dey". From an autonomous model of literacy perspective, what is at issue is the student's acquisition of the skills for orally decoding the graphic sign "they" and his ability to render the sounds according to the norms of the dominant language variety, namely White standardized American English. From an ideological model of literacy, the question to ask would be what social practices are being enacted in this social event and what social ideologies and power relations are those social practices indexing? For example, consider the classroom event displayed earlier in which the teacher and students enact a discourse pattern of teacher initiation—"What is this word?"—followed by student response—"Dey"—followed by teacher evaluation—"Look at my tongue. They". This interactional pattern is a widespread classroom social practice often referred to as Initiate-Response-Evaluation (Mehan, 1979). As social practices are enacted within specific events, the social practice is refracted (modified) to address the specific situation and social context. In this case, the specific social situation includes racially-aligned language variation and power relations, a school district policy that emphasizes phonics-based reading instruction requiring "correct" and fluent oral rendition of "basic" words, interpersonal tensions between the teacher and the student and between the school and the local African-American community, as well as a broader social, political and historical context of segregation and a denial of civil and human rights to people of African descent in the United States. What is being taught and learned in this social event is not a set of decontextualized skills but rather a series of social practices about how written language is to be used in such classroom events, about social relations including who the teacher and student are (inclusive of their racial identities), about power relations between the institution of schooling and local communities, about who can claim belonging to the space of that classroom and school, and about the institutionally assumed qualities of the kinds of persons to be found in such locations.

The tension between defining literacy as autonomous versus defining literacy as social and ideological also plays out in multimodal and digital communication. Kress (2010), among others, drew attention to the ways in which print texts increasingly include visual images and spatial organization and online digital texts include a wide range of modes: images, moving images, sound, subtitles, speech, bodies and proxemics etc. Being able to read a text involves incorporating modes in addition to printed words. While multimodal texts have been ubiquitous long before digital communication, the widespread use of digital communication has highlighted the importance of navigating multimodal digital texts. Statistics show that the use of digital technologies is widespread and popular globally, especially among younger generations. As such, educators and educational researchers have, *ipso facto*, argued that the literacy skills needed for using digital technologies should be taught in school as part of the language arts—another iteration of the autonomous model (Baker, 2020).

From a social practices and ideological view of literacy, it is important to situate digital technologies within the complex, situated social contexts of their use. One needs to ask—how is any technology associated with written language (whether it is a stone wall and a burnt stick, paper and pencil, a sophisticated personal computer connected to the internet, or a networked system of school computers) being used, to do what, by whom, when, where, and how, within what social and historical contexts? Simultaneously, one needs to ask—Who has access to which technologies? What does the choice of technology accomplish? What modes do different technologies enable? What does a chosen mode mean, signify, and do?

The social impact of autonomous and ideological models of literacy in the classroom

Banks (2006) situates the tension between autonomous models of literacy and social practice/ideological models of literacy in African American history and its resistance to racism, oppression and Whiteness. He writes:

... rather than answer either/or questions about whether technological advancement and dependence leads to utopia or dystopic, whether technologies overdetermine or have minimal effects on a society's development, or whether people (especially those who have been systematically excluded from both the society and its technologies) should embrace or avoid those technologies, African American history as reflected through its rhetorical production shows a group of people who consistently refuse to settle for the limiting parameters set by either/or binaries. Instead, African Americans have always sought "third way" answers to systematically racist exclusions, demanding full access to and participation in American society and its technologies on their own terms, [using their own discursive practices] and working to transform both the society and its technologies, to ensure that not only Black people but all Americans can participate as full partners (pp. 2–3; original emphases).

The issues raised by Banks are not limited to the United States (for example, see [Faloye and Ajayi, 2021](#); [Nemer and Gray, 2019](#)). While access to new technologies has created what has come to be called “the digital divide”, access is not just a technical matter, but rather more complexly as part of relations of power (e.g., [Hoffman et al., 2001](#); [Strover, 2014](#)). These relations of power manifest themselves not simply as a matter of hands-on keyboards but more so as a tension over who one can be, where one can be, how one can be, what one can do, and whose literacy practices count within what social contexts including those social contexts that substantively involve the use of digital technologies.

For example, consider a 10th grade language arts classroom in which the students are exploring “The American Dream” from the perspectives of minoritized people (see [Bloome et al., 2019a](#), for a more detailed discussion of this classroom event.) They had been to a local museum to see an exhibit on the topic, generated essential questions to research, completed the research, presented to the class on their chosen essential question, and then engaged in a Socratic circle (a whole class peer discussion group) on a question the teacher posed, “What is the American Dream?” The students were from racially and religiously diverse working-class neighborhoods. Throughout the instructional unit, the students used a range of digital technologies including their cell phones with a broad range of apps (including word processing, internet search engines, Facebook, a broad range of other social media apps, and more), chrome books, a classroom desktop computer, smart board, and a school-based WIFI system. A few students also had digital notebooks. While some of the students did not have digital communication devices or WIFI access at home, many did. Throughout the instructional unit, regardless of the activity, students were often multi-tasking on their digital devices—interacting with others in the class or the teacher while also engaged in their academic work.

During the instructional unit the students saw a photograph by Louis Agassiz. Originally, the students believed that Louis Agassiz was Black and that his photographs were meant to show the painful conditions in which Black people lived. It was only when one of the students was researching him on the internet that she found out that he was White and a promoter of scientific racism. She told the teacher and included a photograph of Louis Agassiz in her PowerPoint presentation along with some other pictures he took, which she used to explain what scientific racism was. This led to a heated discussion in their Socratic Circle between a few of the White students and the Black students (and other students of color) about discrimination versus racism. The discussion affected future class discussions and social and friendship relationships.

Even a surface level look at the classroom events described above shows students’ resourceful and agentive use of digital technology, using apps, websites, and social media to explore their different concerns. Although the school district had implemented a series of filters that prevented students accessing particular types of web sites, when students wanted to access a particular web site that was blocked by the school’s chrome books or its Wi-Fi filters, they would use their smart phones to access those web sites. As [Hill \(2017\)](#) has noted in her study of young Black women’s digital composing in classrooms and in their homes and communities, students more freely employ their imaginations and bring their own experiences and thoughts to their composing outside of teacher surveillance.

While nearly all students used popular social media sites (e.g., Facebook, Wikipedia, Instagram, TikTok), their use of other web sites and networks was differentiated by race, heritage, and religion. Although the students had similar digital devices and tools, their experiences in digital communication and their social practices of use varied largely aligned with their different social identity positions.

Digital communication is not simply a matter of new technologies that require a set of autonomous, technical skills to engage with them—it is fundamentally ideological. As with print-based literacy, the social events that occur through digital communication involve tensions between the use of those social practices derived from the social, historical, cultural, and linguistic experiences of dominant groups and those social practices grounded in the experiences of marginalized groups. It should come as no surprise that the power relations of race play themselves out in and through digital communication; nor should it come as a surprise that marginalized students find ways to engage with digital communication that reflect who they are and how they are in the world. We believe that equity in literacy education requires us to embrace such diversity. Language arts needs a vision of literacy that is inclusive of students’ different ways with words ([Heath, 1983](#)) what Banks calls “discursive practices,” that is open to changes in the communication landscape, and that prepares students to understand and use the technologies and semiotic resources needed to meet the literacy challenges of different, ever-changing social contexts.

From the perspective of an ideological model of literacy, autonomous models are a non-sequitur. They are themselves a particular kind of ideological model that universalizes particular set of ways of using written language (the literacy practices of a socially, culturally, and politically dominating group) and denies the legitimacy and even existence of the literacy practices of other social, cultural, and linguistic groups. It is in this sense that a universalizing ideology obfuscates how it produces deficit theories aligned racially, culturally, linguistically, socio-economically, and in terms of neurodiversity. The tension that characterizes the schooling of literacy is not between autonomous and ideological models of literacy. Rather, the tension is between the privileging and hegemony of those literacy practices associated with dominant social, culturally, racial, linguistic, and economic communities and their enactment in classroom literacy events and, on the other side, recognizing, validating, and employing those literacy practices associated with a broad range of communities including marginalized communities. It is a tension not only about how to teach reading and writing but also about the system of social identities that students are allowed to envision and that are assigned in schools ([Worham, 2004](#)).

From a view of language as bounded, codified and socially stratified to a view of language as fluid and variable in relation to social purpose and context

Language arts education, with few exceptions, is explicitly designed to give students access to the dominant variety of a language, so that students learn to use it “correctly” in speaking and writing. This normalizes and standardizes the variety of the language spoken in school and dominant society as the home language of powerful elites, despite the fact that in some countries the home language of the majority of students is not the dominant language (for example, in South Africa, Zulu is the language spoken by most people, English and Afrikaans are minority languages in terms of the number of speakers; yet English is the dominant language with regard to schooling and government; Posel et al., 2020).

The restricting of language arts education to the dominant language of the society (or nation-state) is also, in part, the result of conceptualizing languages, dialects, and creoles as bounded, integral entities. Such a conception derives from a monolingual ideology that ignores the fluidity in use among named languages (Garcia and Wei, 2014; Makoni and Pennycook, 2007) as well as among dialects of the same language. Research shows that languages are not, metaphorically speaking, hermetically sealed; language contact is ubiquitous and is one of the main drivers of ever-present language change (Crystal, 2003). Although what counts as “correct” varies according to context, curriculum policy in language arts education around the world, with few exceptions, mandates the teaching of the dominant variety of the language, elevated by codification in prescriptive grammars and dictionaries. In brief, a majority of students world-wide are discouraged from using the full extent of their linguistic repertoires in language arts classrooms. A consequence of organizing the language arts curriculum around the trope of a dominating language is that speakers of other languages or varieties are constructed as lacking even if they speak several languages. At issue in the context of language arts education is that the rejection of non-dominant languages/varieties, multilingualism, and translanguaging from language arts classrooms marginalizes students who are speakers of these excluded languages, makes difficult their participation in instructional activities, and erases their voices (McKinney, 2017). In the case where the language of the school is dominant and historically colonial, the use of local, indigenous languages constitutes a decolonizing act of language resistance (e.g., Ramanathan, 2014; Reyhner, 2010).

The expulsion of African-American language from the classroom

The defenestration of African-American Language from language arts education in the United States, which has taken place in the historical context of the enslavement of African peoples and their subsequent segregation and oppression, delegitimizes the language and the culture (Baldwin, 1979; Scott et al., 2009). Sociolinguists have argued that African-American Language is a language in its own right and not a dialect of White Mainstream English (also referred to as Standard English) (Alim and Smitherman, 2012; Baker-Bell, 2020). This argument is based on linguistic evidence of the systematicity of African American Language and its distinct phonological, syntactic, and semantic systems (Ball et al., 2003). In the United States with its multi-racial population and its history of enslaving people of African descent and subsequent racial segregation, the exclusion and erasure of African American Language from the classroom can be viewed as a continuation of that racialized history, its violence, and the state-sponsored effort to delegitimize the full humanity and personhood of people of African heritage. That is, as Williams (1977) notes, “A definition of language is always, implicitly or explicitly, a definition of human beings in the world” (p. 21).

As such, the defenestration of African American Language from the language arts classroom can be viewed as a defenestration of African American people, culture, history, community, and children from the classroom. Following Baker-Bell (2020) recognizing African-American language as a language in its own right, (a) draws attention to anti-Black linguistic racism, (b) creates awareness of the vitality of African-American Language and the literacies and literature of African-American people, including students, (c) asserts students’ rights to their own language in the classroom (d) asserts the full personhood of children (and others) of African heritage, and (e) challenges the foundations of language arts education that takes for granted the exclusiveness of monolingualism and White standardized English.

Teaching the dominant language as the language of language arts is often justified as providing “the same education for all students” ensuring equal access to the economic, educational, social, and cultural opportunities in society. Yet, with such an approach that ignores inherent relations of power that are embodied in language (Bourdieu, 1991), students not only are denied access but also have their personhood threatened. This tension is at the heart of what Janks (2010) refers to as the “access paradox.”

There are curricular and instructional alternatives to language arts pedagogies that are monolingual-centric. These include:

- Translanguaging pedagogies which are inclusive and respectful of the fact that the language(s) students speak are inextricably bound up with their sense of identity community and belonging (e.g., Canagarajah, 2013; Makalela, 2015; McKinney, 2017; Baker-Bell, 2020).
- Third Space pedagogies in which local literacies of students from non-dominant communities are celebrated and constitute a basis for transformative spaces for new learning (e.g., Gutierrez, 2008);
- Cultural modeling pedagogies for teaching literature (e.g., Lee, 2004) in which students’ uses of language outside of the classroom and their local literacies are used to frame and define literary study;

- Early reading and literacy pedagogies that encourage students to use their own home languages to read and write about their own communities, culture, families, and lives;
- Curricular units for the study of language variation and for the field study of language diversity in students' own communities (e.g., Egan-Robertson and Bloome, 1998).

Promoting linguistic diversity in language pedagogy

Language study within the language arts classroom can supplant monolingualism with a curriculum that emphasizes linguistic diversity as a productive resource (rather than as a problem). For example, the curricular and pedagogical approach known as Language Awareness (Hawkins, 1987) encourages students to think about the differences between inflected and analytic languages, stress-timed and syllable-timed languages, cognate and non-cognate languages, and so forth. For example, in South Africa it helps if one understands the difference in the vowel phonemes of African languages and English. Because many African languages have only five vowel sounds, it is difficult for African students to recognize and produce the distinctions between long and short vowels in English (e.g., ship and sheep). Similarly, because African languages use tonal variation to produce different meanings, many English speakers cannot hear or make these distinctive sounds.

Because the language of language arts education is generally taught as a bounded entity, grammar instruction (also called language study) focuses prescriptively on the grammar of the dominant variety. Moreover, the study of grammar is often treated as a stand-alone, decontextualized aspect of language arts in education policies and standards (Zuidema, 2005). We note that there is an ongoing debate about whether grammar instruction should focus on skills acquired through drills, examine linguistic structures within model sentences and texts, or be supplanted by attention to rhetoric emphasizing how grammar affects meaning (Myhill, 2018).

Linguists make a distinction between prescriptive and descriptive grammars. Prescriptive grammar imposes standards and rules for how people *should* talk and write, including what tense to use, whether or not to use the third person, when to use the passive voice, the correct tense and so forth. Mandating the correct pronunciation of a word is also prescriptive. The grammar taught in language arts classrooms is predominantly a prescriptive grammar. These prescriptions are usually based on formal written language and not on how people actually speak in everyday life.

By contrast, descriptive grammar is based on how people actually use language in communication without a judgment of correctness. Descriptive grammars therefore recognize variation in how language is actually used, and they accommodate language change. Change in language happens slowly but can be seen in process.

Beyond the "correct" use of the dominant language, schools are also concerned that students learn to use language appropriately. We use "appropriately" here, to refer to the complex issues of ethics, group social identity, and power relations that underpin what Hymes (1972) described as "the rules of use" and what Cameron (1995, 2000) has labeled "verbal hygiene". Verbal hygiene refers to the broader social, cultural, and political processes by which the state, social groups and social institutions regulate language appropriateness. The cultural variation in language use (e.g., swearing, turn taking processes, acceptable volume, eye contact) together with cultural variation as to the appropriate choice of language variety, means that students are often expected to unlearn the verbal hygiene practices of home and community and subscribe to those mandated by institutional power relations. Appropriateness is then policed by teachers or others with institutional authority.

Cameron also notes the complex dynamics of verbal hygiene in the promulgation of so-called "politically correct" talk. Using sexist language as an example, Cameron says,

There is nothing trivial about trying to institutionalize a public norm of respect rather than disrespect ... through linguistic choices: in the context of addressing or referring to someone, words are deeds. Compare "hey, bitch!" with "Excuse me madam" (1995, p. 143).

Having seen the success of feminist interventions to abandon the sexist use of "he" as a generic pronoun in English, we now see the pronoun system slowly returning to an older use of "they" for both third person singular and plural, to accommodate people who do not confirm to the gender binary instantiated in "he" and "she".

Cameron (1995) notes that verbal hygiene includes language that obfuscates reality giving Newspeak, as described by Orwell (1949) in his novel 1984, as an example. In our current post-truth era, one would assume that language arts education has a role to play in helping students understand the interests served when the power of language is used to obfuscate reality by generating and spreading lies, alternative facts, and conspiracy theories (especially within the context of social media). Yet rarely is verbal hygiene part of the core of language study in the language arts classroom.

The typical emphasis in language study on form, prescriptive grammar, monolingualism, and dominant language can be productively supplanted by a focus on how language choices yield meaning (e.g., Myhill, 2018; Kamler, 2001) and how language produces and maintains power relations (Fairclough, 1989). Following Halliday on language as "meaning potential" (1985), attention can be focused on how users produce meaning by selecting from the options available in a language (e.g., tense, voice, sequence, vocabulary) or from a broader range of languages and language varieties in their linguistic repertoires. Of course, language

users—whether they are speakers, writers, bloggers, social media users, actors—not only select from the options available in and across languages, they also create new options for making meaning (as occurs in the creation of new words, new grammatical structures, new discourses, mash-ups, intertextualities, new images, etc.).

From defining epistemology and rationality in the language arts as autonomous to dialectical and dialogic social practices

Questions of epistemology and rationality have long been debated in philosophy. Such questions are also central to language arts education (Giroux, 1984; Magrini, 2010; Willis, 2017) although they are rarely explicitly referenced in education policy, practice or research. These questions are essential to argumentation, which is ubiquitous in language arts classrooms, especially in the teaching of literature and in the writing of essays. Manifest in the teaching of argumentation is a growing tension between stances toward epistemology and rationality that are given, autonomous, and formulaic, and approaches that are dialogic and dialectic. The former is typified by what is commonly taught as the five-paragraph essay (also known as the three-pronged essay): the writer presents a thesis or claim in the first paragraph, writes three paragraphs of supporting evidence, and ends with a fifth, concluding paragraph. In this and similar formulaic approaches to argumentation, students begin with a claim or thesis and then seek out supporting evidence. The ethical obligation inherent in argumentation oriented to supporting an *a priori* claim is advocacy for the selected thesis or claim. Within this framework, students' written arguments are often assessed by their inclusion of the structural components of an argument.

In some classrooms, two students may generate antithetical claims but if each has evidence and warrants to support their claim, both are evaluated as good arguments (a relativistic epistemology). In other classrooms, arguments are set in competition with each other, the winner having the stronger evidence and warrants (similar to how lawyers are viewed as making arguments in support of their clients). When students are taught that arguments are to be won or are relativist, they lose opportunity for nuanced dialog (Clifton, 2017). As such, students may view knowledge and rationality as universal instead of understanding knowledge and rationality as a social, relational process that acknowledges knowledge as fully embodied in relation to how we are in a social world (Newell et al., 2015).

Implicit classroom communication about knowledge and rationality

The use of the five-paragraph argumentative essay in primary and secondary classrooms does not usually involve explicit discussions about what counts as knowledge or what is rational. In a social and political context in which assertion substitutes for argumentation and empirical facts and material realities have the same status as "alternative facts" and fantastical conspiracy theories, many teachers find it challenging enough to teach students that claims need evidence. Nonetheless, even in such classroom situations, definitions of epistemology (Newell et al., 2014) and rationality (Wynhoff Olsen et al., 2013) are being taught, albeit implicitly. For example, consider a high school classroom in which the students are writing arguments about whether Atticus Finch, the protagonist in the novel *To Kill a Mockingbird* (Lee, 1988), is a hero. In response, the students pick a side and then search the literary text for three pieces of evidence that support their view. What counts as knowledge is text from the novel. The experiences the students themselves have had with race and racism are not even considered as possible evidence in support of their claim. What counts as epistemology and rationality exists autonomously, in isolation from the particular life-experiences the students have had. Imagine that this classroom consists of only White students who have grown up in a nearly all-White, *de facto* segregated community and school system. Imagine also that these students have repeatedly heard from popular media and other social institutions in which they participate (e.g., church, family) that racism was a problem in the United States, but that racism no longer exists. In their argumentative essays, students may include as a given truth (as not needing evidence or backing) the condition that racism was a problem "back then" (at the time in which the novel was set) but that it is no longer a problem. Their own personal experiences are such that there is no challenge or alternative to that belief. Thus, it appears to them "reasonable" and "rational" to build an argument based on the premise that racism was a problem but no longer is.

Now imagine that the students in the class are racially diverse and have grown up in a racially diverse community and that some of the students in the class (and some of their family members) have experienced racism, including racist violence. As the students share their theses and the evidence they are using to support their theses, classroom conversations may be characterized by disagreements and by the sharing of different experiences leading students to question the theses they have had. Perhaps the classroom dialog results in students having more sophisticated theses and more complex arguments. As such, the argument being made eschews the selection of a claim followed by the searching only for supporting evidence; and, by contrast, engages the students in exploration of the diverse kinds of evidence in search of a thesis that all the evidence supports. The point here is that what counts as knowledge and what counts as rational are socially situated even when on the surface they may not appear to be so.

Consider another high school classroom in which the students are reading and discussing Hemingway's short story, "Indian Camp" (1924). The students offer various interpretations of what happens in the story and what those events mean. The teacher requests that students support their interpretations and assignments of meaning by asking, "What did you find as evidence?" Implicitly, the teacher is asking the students to take a stance regarding what can and should count as knowledge (epistemology) and what

is reasonable (rationality) in their interpretations of the literary text and in their assessments of others' interpretations. Literary scholarship on "Indian Camp" characterizes the short story as a "Coming of Age" story (e.g., Young, 1964). One way to approach the teaching of "Indian Camp" would be to tell the students what literary scholars have decided about the story's meaningfulness. Students might be held accountable to craft arguments about the meaning of the story that are aligned with what literary scholars have decided. In such a case, epistemology and rationality are located outside of the classroom and outside of students' experiences; epistemology and rationality are, respectfully, autonomous and universal.

Consider an alternative classroom scenario: Imagine that the teacher has asked students to read the story and then make an argument about what kinds of dominance they found. Perhaps some students respond to the task by quoting text from the story, assuming, without reflection, that only textual evidence counts. Perhaps the history they have had in language arts classroom discussions has neither sanctioned other kinds of evidence nor asked students to explain how a particular bit of textual evidence warrants an interpretation. Perhaps a particular quotation from the literary text does not seem to the other students nor the teacher as a reasonable warrant for a particular interpretation or perhaps they all take the stance that each person is allowed their own interpretation regardless of whether the quote seems to others as reasonable evidence for the interpretation. Implicit in the relationship between evidence and an interpretation—the warranting—are assumptions about what is reasonable and what is not (Wynhoff Olsen et al., 2013).

Alternatively, imagine that the students get into a heated debate about whether a particular bit of text is evidence of, for example, misogyny. Some students might argue that the use of a pen knife by the doctor to perform a Caesarian birth and the ignoring of the woman's screams are evidence of a disrespect toward women. Other students might argue that the doctor needed to ignore the woman's screams in order to save her life. The teacher might orchestrate the classroom conversation so that the students cannot ignore addressing each other's arguments, pushing the students to explore and unpack the literary text in more detail and to bring their own knowledge and experiences about misogyny into the argument (experiences that may vary greatly depending largely on the gender of the student). Implicit in this classroom discussion are questions about what counts as evidence (epistemology) and what counts as reasonable warranting (rationality). Is it reasonable and rational for some students to ignore the evidence that other students have presented about the misogyny they have experienced and that they see in the story? Such ignoring might be characterized as a definition of irrationality (cf., Habermas, 1984). Returning to the teacher's decision to ask students to read the short story within the framework of dominance, would it be rational to read the story as a "coming of age" story that ignores misogyny and racial oppression especially given that it is part of the social context in which students live? The issue here is not just what counts as epistemology and rationality in the two classroom lessons described, but rather that what happens in such classroom events is the implicit socialization of students to institutionally supported definitions of epistemology and rationality.

Epistemological regimes

In their study of the teaching and learning of argumentation in high school English language arts classrooms, Newell et al. (2014) organize epistemologies into four groupings: given, relativist, critical, and dialectical. Given epistemologies locate knowledge in authorities who represent (are delegates of) Truth. An exemplar of a given epistemology is New Criticism. Students acquire the Truth from their teachers through didactic pedagogies (what Freire, 1972b, calls a banking model of education). Relativist epistemologies locate knowledge in the individual and in the individuals interaction with texts. An exemplar of a relativist epistemology is Reader-Response Theory (e.g., Rosenblatt, 1938, 1978). Students acquire knowledge by exploring their own meaning-making grounded in their own experiences as they interact with texts. Critical epistemologies locate knowledge in the interrogation of power relations that have resulted in civil, social, and economic inequities grounded in racial, gender, language, and class ideologies of hierarchy (e.g., Appleman, 2014). Dialectical epistemologies locate knowledge in the tensions that arise when people engage each other in dialog grounded in the material realities of their lives.

Note that each epistemology involves relations of power in locating authority for what counts as knowledge and what counts as reasonable. For example, there may be a top-down power relation between "authorities" in the field of literary scholarship (typically prominent literary scholars at elite universities) and the teacher, and between the teacher and the students. The correct interpretation of a literary text is established by elite authorities and the language arts teacher holds students accountable to acquiring that interpretation with its given evidence and given warrants. By contrast, power relations associated with relativist epistemologies may appear equal and democratic among the readers of a literary text as each reader has the power to articulate their own interpretation using their own definition of evidence and own rationality. Thus, the power relation between teacher and students is one in which the student is accountable to the teacher for articulating an individual interpretation that seems to the teacher to be authentic to the student's own individual experiences as applied to the literary text. Critical epistemologies requires teachers to provide students with an analytic framework that, in part, derives from a set of critical social theories and, in part, from the student's own experiences of oppression and exploitation. As such, the power relation between the teacher and student is one in which the student has authority (power) for interpreting a literary text; but in generation of an interpretation students are held accountable to teachers for using a critical framework and for using a particular set of their experiences. Dialogic epistemologies aspire to power-relations as held jointly and collectively by people (teachers and students) who are in dialog with each other. However, rarely is it the case that dialog occurs in a social context devoid of power relations and thus interpretations that are generated and articulated through dialog reflect the extant power relations.

The classroom dynamics described in this chapter exemplify the movement from epistemology and rationality as given and autonomous to epistemology and rationality as socially situated, dialogic, and dialectic (e.g., Bloome et al., 2019b). Defining epistemology and rationality as dialogic and dialectic, explicitly or implicitly, pushes students to explore and consider all pertinent evidence and potential warrants before generating a claim. Students must also engage others in dialog about the evidence, warrants, and possible claims to understand others' perspectives producing either a consensus or a situationally and historically qualified argument. Such moves push against ideological isolation and echo chamber effects (Mirra, 2018): two byproducts of insulated thinking, social media algorithms for funneling biased information, and an inundation of "alternative facts" and baseless conspiracy theories.

In the classroom described earlier in which the students were discussing "Indian Camp," there was a disagreement among the students about whether there is male dominance over females or White dominance over indigenous people in the short story (as if both were not simultaneously possible). As the students talk with each other, their insights expand (about both the story and about being human more generally). While not all of them come to agreement, their arguments become more sophisticated as they hear and have to engage divergent perspectives. Regardless of whether students eventually come to a consensus in building an argument about the meaning of the short story, what is being taught and learned is that definitions of epistemology and rationality are socially situated, dialogic, and dialectical. We also note that expanded views of rationality promote an ethics of care (Gilligan, 1982) that encourage people to consider themselves in relation to others and as such, take on the experiences of others (both within our time and across generations) as they engage in language arts curriculum.

Final comments

We have described evolving tensions in literacy, language and schooling manifest in language arts education. Heuristically, these tensions occur at both a surface level and at deeper levels. At a surface level, there are evolving tensions in defining literacy, language, and schooling as skills to be acquired with the inherent consequence of generating deficit theories. These deficit theories are aligned with power relations defined racially and linguistically and in terms of class, gender, sexuality, and neurodiversity. Teachers are often forced into prescriptive or restricted curricular choices, spanning across selections and considerations of texts; how to work with a whole class and/or create space for individual reading; and how to invite students to be both consumers and producers of texts and knowledge. Literacy, language and schooling exist in the tension between the pain and suffering of structural and institutional inequality and the ideal of literacy, language and schooling as democratizing practices restructuring power relations. At deeper levels, the teaching of the language arts lies in the tensions between: (a) defining literacy and language as decontextualized, autonomous skills to defining literacy and language as social practices and ideologies; (b) monolingual-centered and hierarchical conception of language to language as multilingual, and non-elitist; and (c) defining epistemology and rationality as context-independent versus socially situated and context-dependent.

How these tensions are addressed have consequences for people in their daily lives, for social institutions, for government, and for the pursuit of racial justice and educational equity. Literacy, language, and schooling are deeply entangled with ways of being, doing, believing and valuing that have profound social effects. Through and through, how the tensions are addressed are ethical and moral issues. Whether it is the storming of the US Capitol, the mass shooting/murder of people of Asian heritage, the murder of African-American people, genocides around the world, among other state and institutionally organized acts of violence and oppression, there has been an ethical and moral failure of individuals, communities, social institutions, and government to address the language and literacy events that have preceded these atrocities. It is also an educational failure. However, it is also the case that language arts education and language arts research have the opportunity to provide people, their communities, and their social institutions with an understanding of how language, literacy and schooling might be used to create futures that resist deficit theories, emphasize mutuality and respect for others, and pursue racial justice and dignity. Following Freire, language arts teachers and educational researchers can frame language arts and literary education to ensure that students are "creative subjects" (1972a, p. 29) with the power to use language and literacy to "name the world, to change it" (Freire, 1972a, p. 61), and who accept the responsibility to care for both the word and the world in their splendid diversity.

Reading comprehension in troubled times

We write this chapter in the year 2021, at a time in which a litany of political, social, and health crises continue to confront the global community. In light of these challenges—and those that lie ahead—we consider (more aptly reconsider) how reading research speaks to this moment: What does it have to say about the skills (and knowledge) needed to make decisions as global citizens in an era and a world filled with social injustice, misinformation, and all too little cooperation and understanding within and across a host of boundaries?

In the main, the vast body of existing scholarship on teaching reading comprehension has not strayed far from the project of making meaning of individual texts for the purpose of temporally proximal engagement in discussions and written activities. Over the last five decades, reading researchers have produced a vast body of scholarship on teaching reading comprehension. Within these studies, comprehension instruction is often characterized as a portfolio of practices that help readers navigate the meanings that reside at the intersection of the reader, the text, and the context. By and large, the interventions described in this extensive body of research have focused on developing the reader's skills and knowledge, so they can better uncover—or construct a version of—meanings inscribed in text. These interventions have largely avoided a committed engagement with context (see [Pearson and Cervetti, 2015](#)). Instruction has focused on helping readers locate or recall information from texts, distinguish main ideas from supporting details, and make relatively shallow inferences among the ideas in a given text and between those ideas and their background knowledge.

Thus, reading comprehension, in the way we currently study, describe, and teach it, typically gets at what texts say (understanding and recalling explicitly stated key ideas and details), and what texts mean (where and how those ideas connect to one another and connect to existing background knowledge). Occasionally, reading comprehension instruction also involves engaging students in conversations about how texts work (when we study authors' craft and matters such as word choice, point of view, and shades of meaning), and even how language works. Rarely, comprehension instruction engages students in learning about what texts do (when we analyze and evaluate how texts and authors position readers and their cultural assets, and perspectives—privileging some and marginalizing others, or how we can use and apply the insights and knowledge we gain from our understanding to DO something out in the world). Research on this classic version of reading comprehension instruction has been summarized many

times over the last 35 years (Pearson and Cervetti, 2017; Duke et al., 2021; Pearson and Fielding, 1991; Pressley, 2001; Tierney and Cunningham, 1984; Wilkinson and Son, 2011).

As we considered the extent to which current reading research and instruction helps to prepare students to address pressing global challenges, we turned to a set of theoretical and pedagogical resources. First, we identified three loosely coupled traditions, each of which offers opportunities to reimagine comprehension beyond the boundaries of textual meaning making: Critical Literacy, Global Literacy, and Digital/Multimodal Literacy.

Second, to ground our work even more directly in pedagogical matters, we turned to Freebody and Luke's Four Resources Model (Freebody and Luke, 1990; Luke and Freebody, 1999), especially as it has been reframed to invoke a more critical view of what is involved in comprehension (Luke et al., 2011), or reimagined to apply to the rapidly expanding representations of meaning we encounter in digital/multimodal "texts" as well as conventional print (Serafini, 2012). The Four Resources Model describes a set of roles that readers play as they interact with text. The first two roles—the code breaker and the meaning maker—correspond to much of existing research on the nature of reading comprehension. But it is the final two roles that serve as the basis of our inquiry in this chapter. In the text user/analyst or analyst role, readers approach texts with an eye to how the construction of a text relates to its uses (e.g., how genre and discourse shape the meanings of inscribed messages) and how readers might use texts in the world outside. In the text critic role, readers consider the ideologies, interests, and voices at play in texts, as well as voices that are missing.

For the pedagogical emphasis, we looked to research that bears on these final two roles. In expanding reading comprehension to include the world that is represented in texts and the ways that texts are both shaped by and shape the world, the Four Resources Model orients reading, and thus, reading instruction, toward the purposes that inspire this essay—engaging in the global project of creating a safer and more equitable world. In particular, we draw on research around three pedagogical traditions—critical literacy, global literacies, and digital literacies—to consider what we do and do not know about how the skills necessary to enact the text user/analyst and text critic roles might be cultivated through ELA instruction.

As we searched for research about the nature and efficacy of attempts to use critical, global, and digital literacies to support students in taking on text user/analyst and text critic roles, we mainly found cases of individual classrooms and teachers that examined classroom practice with the "up close and personal" lenses of ethnography and discourse analysis. Hence, we shifted our goal away from attempting to generalize about efficacy (although we do refer to summaries of efficacy studies available) to accumulating and describing a rich and diverse sample of thick descriptions of this kind of instruction in action. This places limits on generalizations about the relative efficacy of different approaches within this body of instructional research. We are content, at least for now, to provide an account of what teachers can accomplish with different approaches to achieving the major goals of critical, global, and digital literacies. It is important to note that while this work can take place in different disciplinary contexts, we limited our investigation to ELA instruction, crossing over to science or social studies if and only if research in ELA was unavailable and the focus of a study was clearly on understanding or critiquing text in those disciplines.

Theoretical traditions

As a starting point for this inquiry, we briefly discuss critical literacy, global literacies, and digital multimodal literacy as three broad traditions that can inform the roles of text user/analyst and critic. We then discuss four practices that are valued within these traditions and describe what we know about their instruction from existing research.

Critical literacy

Critical literacy has roots in critical social theory, with its interest in the formation of a more just world through the practice of critique and social action. Critical literacy takes up these concerns in relation to the ways texts are regarded, interpreted, and. Texts are viewed as socially constructed and designed to present particular perspectives and worldviews that are necessarily selective and interested. In addition, these representations are viewed as having real world consequences as they shape understandings about culture and society and sustain dominant interests (Luke, 2018).

Grounded in the writings of the Frankfurt School Critical Theorists (see Bronner and Kelner, 1989; Freire, 1970), and critical postmodernists (e.g., Peters and Lankshear, 1996), critical literacy concerns itself with understanding the ways in which texts and discourses operate in social institutions to represent the world, construct identities, and position readers (Luke, 2000). Critical literacy is also concerned with devising ways of reconstructing these texts and, hence, the world. O'Brien (2001), a classroom teacher, wrote of her critical perspective:

[Texts] create ideologically-motivated versions of the nature of the social world and the complex, shifting unequal power relationships—e.g., those based on race or gender. From this perspective, texts are not fixed and complete objects to be comprehended, but opportunities for discussion, argument, and challenge as well as for enjoyment, information, and pleasure (p. 40).

According to McLaughlin and De Voogd (2004), critical literacy uses careful examinations of power relations in text to understand social problems in their complexity and to seek alternative explanations and underrepresented perspectives. The ultimate goal

of critical literacy is to prepare learners to understand power relations in texts and in the world so they can take action in the interest of creating a more just society (Vasquez, 2017).

McLaughlin and De Voogd (2004) describe a number of different instructional approaches for helping students develop a critical stance, including:

- Engaging in problem posing by questioning the author's message and representations using questions like, "what does this author want us to think?" and "how might alternative perspectives be represented" (p. 53).
- Juxtaposing different texts and images in order to consider multiple perspectives represented within and across texts.

Global literacies

A second, more recent perspective on literacy education that bears on the roles of text user/analyst and text critic is global literacies (Rizvi, 2009; Tierney, 2019; Tierney and Pearson, 2021). Dwyer's (2016) definition of global literacies includes elements of critical literacy with a stronger focus on cultural knowledge. Dwyer argues that information technologies are creating connections and interactions with diverse cultures and traditions. Global literacies involve the ability to analyze contemporary and historical issues from a perspective of understanding and respecting diversity.

Dwyer describes different sets of capabilities that students need in order to be globally literate, including:

- Ability to investigate the world and analyze complex global issues.
- Ability to be critical consumers of media (think critically, reflect, form judgments, and ask questions from multiple perspectives)
- Ability to conduct intercultural dialog across multimodal and print platforms
- Ability to hold an ethic around diversity and ethical orientations

Tierney (2019) describes global reading as a shift toward supporting meaning makers in "moving beyond their own cultural bubbles and self-interests to weighing information from multiple informants and multiple sources" (p. 42). This involves educational practice that leans toward multiculturalism and multilingualism, engaging students with global and cross-cultural issues. It also involves engaging students with diverse stakeholders and texts as a way of exploring different viewpoints, perspectives, and positionalities. These ways of reading invite students to step outside of their own views to imagine what the world, and the texts they read, might look like to others. Further, global reading develops an orientation that moves even beyond critique to action—a disposition to change the world in the name of social justice or equity and an ability to analyze complex global issues with an eye to solutions.

Yoon et al. (2018) describe an instructional framework that brings together critical literacies, global education, and multicultural education into a unified approach for using literacy instruction to develop responsible global citizens who see themselves as belonging to a world community that extends beyond local and national boundaries. In developing the framework, Yoon et al. invoke a "critical cosmopolitanism" that includes a focus on critical engagement with global issues and a focus on social transformation through action. The framework includes guidance for teachers on helping students:

- Develop an interconnected view of the world by engaging with world events and issues, using critical questions to understand the complexities of these issues (e.g., air pollution) and the ways that they reveal global interconnectedness
- Form connections between the global issues they investigate and their everyday lives and activities by reading about and investigating local issues (e.g., fracking) and personal practices (e.g., what they eat, the media they consume) that have global connections
- Analyze texts from global and cross-cultural perspectives by, for example, bringing these perspectives to bear on canonical literature, comparing Eastern and Western classic texts, and analyzing how advertisements from around the world invoke cultural values
- Learn about and engage in social and political actions to promote social justice.

Digital multimodal literacy

As we have implied, digital/multimodal (hereafter truncated to digital) literacy is often intertwined with both critical and global literacies. Digital literacy focuses on new ways of representing meaning associated with modern technologies and modes of communication. In the "world on paper," that prevailed a century ago (until the advent of movies and television), text is an inherently static mode of representing language and ideas. This world comprises symbols and images that are "fixed" on the paper on which they are printed where they can stand still for scrutiny. Not so in the year 2021; the world on screen seldom stands still. Besides the dramatic shift in our ideas about what text is and how it works, the explosion in modes of representation over the last century, especially the last quarter century, has dramatically altered our definition of what counts as text and how meaning can be represented in our everyday communications.

In terms of multimodality of representation, to the *static* forms already outlined (and more or less assumed in our earlier analysis of pedagogical principles) we must now add dynamic forms (Coiro, 2020). Movies and videos have been with us for almost a century and a half, but with the widespread influence of the internet, *dynamic* representations have become more prominent if not ubiquitous. Meaning potentials are no longer "fixed" on the printed page. Movement, via hyperlinks, can easily transport

the “reader” to almost any point or space within or across representations, whether the representations are themselves static or dynamic. Additionally, the digital setting adds another dimension of complexity because of its capacity to house, juxtapose, and even intermingle all of the modes. Then add the capacity of a digital setting to support both comprehension (readers have to be able to *read* within and across these modes) and composition (readers have a wider array of modes in which to *write* their ideas and interpretations), and the possibilities become even more complex, but also richer.

The capacity of digital, multimodal media to juxtapose so many forms and ideas redoubles the need for greater scrutiny in order to analyze and evaluate how texts and their authors (attempt to) shape our lives as readers in this new world of representation. Along with the wide array of possibilities and affordances that come with this explosion in what counts as a text, or at least modalities of representations, come a dramatically recontextualized, set of practices, strategies, and skills. [Fitzgerald et al. \(2020\)](#) note that “New technologies in particular require us to rethink how readers make meaning, as digital texts afford semiotic opportunities that are different from print texts ([Jewitt, 2005](#))” (p. 6).

In her conceptual essay about digital reading, [Coiro \(2020\)](#) notes key patterns of practices related to digital reading. Both involve the capacity of readers to shift rapidly and nimbly between or among:

- Complex and overlapping processes, including navigation, evaluation, and integration that require readers to move nimbly within and across multiple media (modes of representation) within digital environments, and
- At least two “reading gears,” including what we might call quick reading (browsing, linking, and scanning) and slow reading (the deep, reflective, and evaluation that is the essence of analysis and critique).

We side with [Serafini \(2012\)](#) in arguing that the analyst (with its emphasis on analyzing how writers use form to serve function) and critic (emphasizing the evaluation of the assumptions and consequences of text) roles are even more important in digital than the print formats. Our claim is based on the sheer volume of digital information that requires sorting as well as the lack of any broadly accepted conceptual or rhetorical standards for publishing on the internet. When the world of text is neither curated nor governed, when we live in the democratization of information (some have labeled it the “wild west”), it is important to make sure that every reader brings analysis and critique to the text.

Practices needed to engage as text users/analysts and critics

In the remainder of this essay, we detail a set of four practices derived from critical literacy, global literacies, and digital, multimodal literacies that address the call for students to embody the text user/analyst and text critic roles and that have the potential to do so in a way that develop students’ abilities to engage with contemporary dilemmas that have roots in social, political, and ideological tensions. For each, we describe the nature of the practice, why it might be important in this historical moment, and what we know about the nature and efficacy of its instruction.

Practice 1: unearthing ideologies in text

What is this practice

From the perspective of critical literacy, meanings are inscribed in text, but they are neither singular nor fixed. From critical perspectives, all texts and readings are embedded within normative relations of power and value and reflect the cultural positions and ideologies of the writer and reader ([Luke, 2000](#)). Thus, texts are both composed and comprehended from particular points of view and for particular purposes. Authors use the manipulable features of text (lexical, syntactic, discourse, structural, etc.) to privilege certain meanings, to position readers, and to support particular social relations through their portrayals of the world ([Luke, 2000](#)). Critical literacy seeks to develop students’ ability to read against the text by examining the contexts and features of texts’ construction and by carefully dissecting the meanings that are communicated. These examinations of the ideological dimensions of text are closely aligned with the Four Resources role of the text critic, and involve understandings about text construction and genre that are aligned with the text user/analyst role.

Why is it important in this historical moment?

Through interrogations of power and representation in text, critical literacy raises issues of social justice and equity, particularly related to the marginalization, disenfranchisement, and disadvantage of individuals, groups, or communities ([Vasquez, 2000](#)). From a critical perspective, it is vital to both examine the ways that language and literacy function in powerful ways—in texts and in the world—to produce and reproduce race, ethnicity, social class, and gender positions and to include marginalized perspectives in the school curriculum ([Moje et al., 2000](#)).

Critical literacy practices encourage students to see texts as both fundamentally ideological and also as open to a number of possible readings, including personal, cultural, critical, and resistant readings. Once students recognize that texts are mere representations of reality and that these representations are social and cultural constructions, they have a greater opportunity to take more powerful positions with respect to these texts—to resist, reject, deconstruct, and/or reconstruct them in ways that are more consistent with their own experiences in the world or in ways that create possible visions of a more just world. These ways of reading have the potential to prepare students to engage in discussions around important social issues and to resist false and problematic representations of the world. They also have the potential to establish a foundation for social action ([Kunnath and Jackson, 2019](#)).

What do we know about pedagogy?

Leonardo (2004) identifies critical classroom dialog as a key pedagogical feature, which includes asking students to critique difficult social problems. Many examples of critical literacy teaching include this kind of dialog, focused on texts and around texts and issues in children's schools and the world.

Critical teachers use a variety of approaches to encourage students to take a critical stance toward text, but critical practice is typically characterized by textual analysis, dialog, and questioning or problem posing. For example, Simpson (1996) documented one teacher's attempt to nurture an understanding among her seventh grade students that characters are not real but are constructed by authors, and that stories are not reflections of reality but selective versions of it. This teacher continually foregrounded the author's role in constructing the text, posing questions such as, "What does the author want you, the reader, to think and feel about particular characters or events? How does he or she achieve this?" Students compared their readings of these texts and examined the ways that the authors positioned them to respond to the texts in particular ways through choices about language, point of view, and other textual features.

Leland et al. (2005) document one first grade teacher's use of the entire range of roles in the Four Resources Model to implement a critical literacy curriculum in her classroom. The teacher used story time to engage students in critical conversations about homelessness and racial injustice. The teacher observed that her students became more aware of social issues, formed intertextual connections as they read, and began to ask more critical questions of the texts they read. She also observed an unusual environment of "acceptance and good will" in her classroom (p. 261).

Even very young children can analyze and question the portrayals of people and communities offered in texts. Labadie et al. (2013) examined the implementation of critical literacy read alouds in a multicultural and multilingual kindergarten classroom. Using texts that highlighted the effects of social class and poverty in different settings, including school and social settings, the teacher engaged students in extended conversations around a recurring set of themes, such as job loss, hunger, and homelessness. Students were also given opportunities to express their thoughts through drawing and writing. Labadie, Pole, and Rogers found that the children began to challenge some common societal views about social class. For example some students talked about how even people who have jobs can struggle financially.

Stevenson and Beck (2017) report on a qualitative study of a summer literacy program for intermediate and middle school children of migrant farmworkers. The program was designed around sociocultural and critical approaches. Students watched a documentary, read YA novels, and read children's books representing the lives of migrant farmworkers and featuring Mexican heritage protagonists. These books addressed a wide range of aspects of migrant life, including challenges related to poverty, working conditions, and discrimination. The students then created their own illustrated narratives about growing up as migrants. The researchers documented students' emerging critical consciousness (or "emergent conscientization") as they began to see their own experiences through the sociopolitical lenses and issues raised by the texts. Some students represented critical understandings of their lives as migrants in the narratives they developed, writing about the bullying they experienced and issues of poverty and child labor. Several of the narratives also included episodes that modeled how teachers and others could help them in overcoming some of these challenges.

Understandings about the constructed nature of texts, the power of texts to offer representations of the world, and the ability of readers to interrogate those representations are perhaps the most fundamental aspects of a critical orientation toward reading. Leveraging these understandings involves stepping into the text user/analyst and text critic roles offered in the Four Resources Model. At the heart of these roles is a move beyond "what the text says" or "what the text means" to consideration of "what the text does" as it describes lives, ideas, and events.

Practice 2: engaging multiple perspectives and positioning

What is this practice?

The ability to approach texts from multiple perspectives is a fundamental aspect of a critical stance (McLaughlin and De Voogd, 2004). Lewison et al. (2002) describe the multiple perspectives approach to critical literacy as asking us "to imagine standing in the shoes of others—to understand experience and texts from our own perspectives and the viewpoints of others and to consider these various perspectives concurrently" (p. 383).

Yoon et al. (2018) describe the development of cross cultural perspective taking skills as central to global literacies. One of these skills is the ability to "deconstruct their own ways of thinking" and analyze texts from diverse perspectives (p. 210). Thus, perspective taking in critical and global literacies involves both stepping into other perspectives and interrogating how one's own experiences shape interpretations of text and the world. This is a recognition that readers, like writers, are influenced by their experiences and their assumptions about social positionality (e.g., gender, race, age, and social class) (Moje et al., 2000).

Why is it important in this historical moment?

Critical educators commonly ask students to reflect on multiple, competing perspectives and examine competing narratives. Some critical literacy theorists suggest that the ability to represent alternative perspectives on information or representations in text may make readers more resistant to manipulation (Leonardo, 2004), an important skill in the current climate of misinformation (Vosoughi et al., 2018).

Others have suggested that perspective taking can build empathy and respect for difference. Pereira and Campos (2014) describe how the affordance of literacy in "offering the lives of others for our contemplation" and the practice of critical analysis and

identification with characters can build student's empathy (p. 359). In one representative study, Mabry and Bhavnagri (2012) demonstrate how non-immigrant students who were encouraged to engage in perspective taking were able to internalize and reflect on characters' experiences while engaging with children's literature about immigrant families. The students formed connections between their lives and those of the characters and expressed empathy and understanding of the immigrant children's feelings and experiences. Mabry and Bhavnagri (2012) point out that perspective taking is critical in diverse societies and foundational to cross-cultural communication. In an increasingly connected world with global challenges like the health and environment we are currently confronting, cross-cultural empathy and communication are essential. The capacity to assume different perspectives can, and we think should, promote both more resistant and more empathetic readings of text, enabling readers to be both more open and more closed to alternative readings of the word and the world, depending on the experiences and purposes readers bring to the reading event.

What do we know about pedagogy?

A number of articles by and for teachers describe instruction aimed at helping students use texts to take on new perspectives, develop deeper understandings of complex issues, and cultivate empathy. For example, Newstreet et al. (2019) describe how Shearer engaged her class of diverse sixth grade students with books about Muslim people and Muslim areas of the world. The students engaged in discussion as they read the texts, and they used internet research to augment their understandings. Their responses involved taking on the perspectives of individuals like those they read about. For example, after reading a true story about a refugee family, the students wrote about how they would feel if they had to leave their homeland. Some students also used the reading to reflect on their own experiences related to immigration. The authors saw evidence that students developed greater empathy in letters they wrote to pen pals in a rural Bangladeshi primary school. The authors argue that developing empathy in this way contributes to understanding and reduces intolerance.

Several studies have examined the use of critical conversations around read alouds can invite very young children to challenge dominant ideologies in text and take on new perspectives. In the Labadie, Pole, and Rogers study (discussed above), kindergarten children began to challenge conventional narratives about issues related to social class, including the nature and causes of financial struggles. Kim and Cho (2017) studied a preschool classroom in Korea where the teacher worked to use literacy activities to foster multiple perspectives and challenge the dominant ideologies inherent in children's books. The instruction took place through read alouds of classic children's books, including *Little Red Riding Hood* and *Snow White and the Seven Dwarves*. Choosing familiar books was seen as a way to engage in critical examination and new ways of seeing the stories. The children were guided to attend to marginalized voices in the stories, to bring their own perspectives to bear, and to challenge the author's message by "talking back" to the text (One example: seeing *Jack and the Beanstalk* from the giant's perspective.) The children used talk and drawing to reinterpret and recreate the stories. The authors present evidence that the children could examine ideological choices in the stories when guided by the teacher's problem-posing questions about whose viewpoint was expressed and who was silenced. For example, with *Jack and the Beanstalk*, the children speculated about the giant's point of view and life circumstances to better understand its frustration with Jack. Their drawings captured these new perspectives, showed empathy for the giant, and challenged the right/wrong duality in the story.

A number of studies describe how children's literature can be used to help students' critically consider their own experiences and others' and the cultural norms and policies that shape those experiences (e.g., Braden, 2019; Kim et al., 2020). Braden (2019) describes a study of third grade Latinx students' discussion of literature on themes related to immigration. The students engaged in read alouds, discussions, and blogging around critical multicultural literature over two months. In addition, students viewed images, watched videos, and had a visit from community members who shared experiences related to immigration. At the time of the study, the students, who were mainly of Mexican heritage, were grappling with new immigration policies in their state, which were impacting their communities and families. In their discussions, the students took up issues around anti-immigrant sentiments, the use of the term illegal, and the family separation associated with immigration. They used the stories and their own personal experiences to reflect on—and reimagine—immigration policy. They also considered different perspectives on immigration and developed alternatives to some of the dominant narratives about immigrants.

Kim et al. (2020) engaged Hispanic kindergarteners in literature-based explorations of gender and family composition that were often unfamiliar to them (Interviews with the children's parents revealed that the parents were concerned that reading LGBT themed books to their children might cause them to grow up to be gay or lesbian.) The students read, discussed, and wrote about picture books about gender non-conforming families, gender norms, and gender identities. Students were initially confused by the books and showed a preference for traditional family structures. The teacher asked students to consider their own experiences and others', to consider what makes a family, and to think about similarities and differences among different families, and to form connections between their own families and the unfamiliar families represented in the books. The children were initially unfamiliar with gender non-conforming families, but came to understand different family structures and to recognize similarities and differences with their own experiences.

As they challenge dominant and often hidden ideologies in texts and consider multiple perspectives, readers step beyond traditional forms of meaning making to embody the analytic (text user) and critical (text critic) roles described in the Four Resources model. These roles invite them into more agentic stances relative to text and more empathetic relationships with individuals and communities whose experiences differ from their own.

Practice 3: orientation toward action

What is this practice?

Critical approaches emphasize the importance of reading for real purposes, including the purpose of creating, maintaining, or expanding social change (Borsheim-Black et al., 2014). To set a foundation for action, critical teaching should help students read the world around them by examining socially relevant issues and current social practices (e.g., McLaren, 1998). Critical teaching urges students to critique current conditions, asking why we do things in the way that we do (Leland and Harste, 2000), what the consequences are for doing things in these ways, and how things might be done differently.

Nichols (2007) offers a vision of education that regards children as social agents and citizens in the present, rather than as citizens of the future. She advocates for literacy as a form of participation in the communities in which they are already members—"the spaces in which children live, work, and play" (p. 123).

Taking children's citizenship seriously means providing educational environments in which educators: model, explicitly teach and provide opportunities for the expression of views; actively listen and respond to children's viewpoints and encourage children to listen and respond to each other; hold up for question adults' views about children; explain that adults sometimes write these views down and that these texts impact on children's lives; and translate adults' texts for children so that children can actively engage with these texts (p. 128).

Moreover, critical literacy moves students from text critics to actors who "undertake transformative social action" in order to build a more just society (Janks and Vasquez, 2011, p. 1). This orientation toward action offers a natural extension of the role of text critic as described in the Four Resources Model.

Why is it important in this historical moment?

The goal of critical literacy is to develop students' agency to address inequities they experience in their own lives, to talk back to texts, to open themselves to the stories of others, and to become decision-makers in the classroom and in their communities outside of school. For many critical educators, the goal is to teach students to use literacy to work for social justice and equity in their lives and the lives of others (Heffernan and Lewison, 2000).

What do we know about pedagogy?

Several studies and reports from the classroom demonstrate the potential for young children to engage in critical inquiry of texts and move from text to the practice of social action. Powell et al. (2001) describe an inquiry-based project undertaken by a group of fourth-graders as an example of critical literacy. The authors described the student's efforts to investigate and ultimately prevent strip mining on Kentucky's Black Mountain. Though the project was not undertaken within an explicitly critical framework, the authors use the project to "illustrate the transformative potential of critical literacy." In another example, Sweeney (1997) describes a set of activities undertaken by her fourth-grade class around the South African elections of 1994, including the culmination of their work in a play about apartheid written by the students and performed for the other classes in their school building.

Curwen et al. (2019) report on a qualitative case study of fifth grade students and their three teachers (at a mainly white upper class school) as they participated in a critical literacy approach to studying the topic of slavery. The instruction focused on:

- Understanding how events are not isolated, but contextualized in particular social, historical, cultural and economic contexts.
- Interrogating the construction and evolution of race and racism
- Examining personal connections with historical events
- Drawing connections between the historical and contemporary—in this case, forms of slavery, and the underlying systems that have perpetuated them
- Interrogating multiple perspectives
- Taking action

The authors report that students were able to form connections across time and difference, recognizing common patterns, such as the human tendency to seek to dominate others. They also came to see themselves as agentic global citizens who could reshape the world through their own actions. The students produced activism-oriented projects in which they engaged in actions, such as writing letters to political leaders about modern day forms of slavery.

Gatto (2013) describes an ethnographic study of a critical literacy unit in her fourth grade classroom. She prompted her students to "do something" about the school lunches they complained about. The students engaged in problem-posing and investigations, many involving the interrogation of real world texts (e.g., letters, menus, blog comments, and newspaper editorial). The students developed a documentary to show to the school board and engaged in other forms of activism to improve the quality of school lunches. Gatto reports that students became more aware of the relationship between language, including text, and power and learned to question and take action on issues related to their lives.

As we suggested at the outset of our account of practice #3, when students move to this practice, they cross over the line from critic to actor in using their understanding and critique of text to engage in transformational social change. This has always been at least an implicit commitment of critical literacy, but in these troubled times, it has become an explicit commitment.

Practice 4: evaluating text

What is this practice?

As we have argued in unpacking the first three skills, texts are never neutral; to the contrary, they are always imbued with ideology that we must learn to read from multiple perspectives in order to take actions to improve the world. In order to enact the first three skills, we need a fourth—the capacity of individuals to apply a consistent set of criteria in order to evaluate the trustworthiness and utility of the information inscribed in texts.

Why is it important in this historical moment?

Paramount among the possibilities and problems that the digital/multimodal world brings to readers of all ages and especially to our classrooms is the issue of the trustworthiness of text information; it isn't that trustworthiness is not required in the world on paper; it's that the expansion in representational affordances and distributed authority for publication render the quest for trustworthiness more salient and more challenging in digital environments. Tom Freedman, NY Times columnist, writing in 1999, recognized this dilemma early on in our dalliances with the internet:

There is a dawning realization that the Internet ... is different from radio, television and newspapers in that it is totally open, interactive technology-but with no built-in editor, publisher, censor or even filters. With one mouse click, you can wander into a Nazi beer hall or a pornographer's library, hack the NASA computers or roam the Sorbonne library, and no one is there to stop or direct you. You interact with the network naked. The only really effective filters are the values, knowledge and judgment that your kid brings to the Web in his or her own head and heart (p. 15-A).

More recently and in a similar vein, the Organization for Economic Co-operation and Development (OECD, 2014), noted that readers can no longer rely on publishers who have traditionally acted as gatekeepers of textually-presented information; thus the responsibility for evaluating information has now become the responsibility of readers. The implication for this essay is transparent: Whatever we have said about the need for critique for garden variety texts goes double or triple for texts on the internet—the ultimate democracy of information. But it is doubtful that even an observer and prognosticator as insightful as Freedman could have anticipated, or even imagined, the blatant disregard for rules of evidence, argument, relevance, or trustworthiness in conveying information that we have witnessed in the last 5–10 years around the world, especially in the United States.

What do we know about pedagogy?

An internet search for the string, “research about teaching students to evaluate text for relevance and credibility” will yield thousands of hits and endless armchair advice and lesson plans about how to engage students in text evaluation, but precious little in the way of research assessing the efficacy or consequences of the recommended instruction. If one adds English Language Arts to the search string, the yield for research is even thinner, probably because science and social studies scholars have worried more about what has come to be called “sourcing” (assessing the accuracy and credibility/trustworthiness of evidentiary text sources) than have scholars who study literary interpretation, where relevance may be more important than credibility or accuracy for selecting a textual evidence to support a claim in an explanation or an argument a reader is constructing.

In one recent review of the scant literature available to assess pedagogical attempts to improve students' ability to evaluate texts on criteria such as relevance, accuracy, and trustworthiness/credibility, Fitzgerald and colleagues found very few pedagogical studies (Fitzgerald et al., 2020). In one exception, with college students reading civics texts, McGrew et al. (2019) found that training to judge text credibility improved scores on a civics on-line reasoning assessment.

In another recent review of intervention studies designed to improve students' sourcing skills (Brante and Stremse, 2018), which they viewed as attending to “metadata” or features of text sources (such as who created it, what affiliations they might have, for what purpose and audience they created it, and where and when it was published or disseminated) that influence readers' assessment of relevance, accuracy, and trustworthiness of the information in texts. From a much larger database, they found 18 studies that were relevant to their charge. The majority of the studies, especially those in elementary and middle school, included a focus on evaluating the credibility of the sources, most often by asking students to provide a rank-ordered list of the credibility of the sources, with modeling, group discussion, and worksheets serving as the primary instruction drivers. A few of the studies (e.g., Zhang and Duke, 2011) focused explicitly on examining credibility and requiring students to provide explanations for rankings of credibility. Very few studies went the next step by asking students to use their evaluation of sources as a criterion for interpreting the issues and questions they were trying to address. Nor did many of the studies focus much on motivation in spite of evidence (List and Alexander, 2017) that balancing ability with motivation is a characteristic of successful document evaluation. Six of the eight interventions that yielded large effect sizes for either judging credibility or interpretation relied heavily on teacher-led interventions. The authors concluded that more emphasis is needed on source evaluation of multiple documents representing different perspectives, as well as providing explicit instruction for judgments of both source relevance and credibility.

We searched, as we have with the other three crosscutting practices, for classroom cases documenting what students are capable of doing when given opportunities to learn these critical skills and dispositions. However, our search yielded very few classroom cases that focused explicitly on evaluating either single or multiple text sources on criteria such as perspective, relevance, accuracy, and trustworthiness/credibility. So we broadened our search, for this practice only, to include both older students and pedagogical experiments that relied on quantitative methods of data analysis. One of the most encouraging studies with college students (Wiley

et al., 2009), involved an instructional heuristic, SEEK (source, evidence, explanation, knowledge) taught to college students. When source evaluation for relevant and trustworthy evidence was a key component of instruction, students demonstrated greater text comprehension and better explanations (in post reading explanatory essays) of scientific phenomena that were the focus of their inquiries. In an experiment with elementary students, Zhang and Duke (2011) taught intermediate grade students a specific approach to evaluating internet sources. The routine (WWWDOT) for evaluating the relevance and credibility of internet sources focused on “who” wrote information (plus credentials), “why” they wrote it, “when” was it written or updated, “does” it meet my needs (relevance), “organization” of the site, “to do” list for follow up. The WWWDOT framework intervention, which consisted of four 30 min sessions, made students, “more aware of the need to evaluate information on the Internet for credibility and better able to evaluate the trustworthiness of Web sites on multiple dimensions.” (p. 145). However, when compared to a business-as-usual control group, WWWDOT students did not perform better in overall judgment about the quality of the information on websites.

Looking across this set of studies for Practice #4, Evaluating Text, our conclusions have a very different tone and voice than do those for Practices #1–3, more than likely because the evidence we were able to find is driven by more conventional outcomes, such as surveys and assessment tasks from which scores are derived and evaluated statistically. Additionally, the studies that have closely examined text evaluation tend to come from the liberal humanist “critical reading” tradition of critique, which is more focused on assessing the internal validity of texts (are the assumptions clear, the claims testable, the evidence linked to the claims through a solid line of reasoning). We found almost no text evaluation studies, even individual classroom cases, that emanated from the critical literacy perspective that is more sensitive to the external validity of texts, where texts are held to account for questions like, whose voices are privileged or marginalized (or silenced), or how power is assigned differentially. Notice that these questions are very similar to those we used to characterize what it means to enact the first practice—unearthing ideologies in text. This means that to evaluate these external faces of text involves unearthing their ideologies. So, to enact practice #1 is to enact this face of practice #4.

But the overall conclusion to be drawn is similar to practices #1–3: We know something about the efficacy and promise of this practice but we have a lot more to learn. Specifically, it is clear that (a) students can learn to apply evaluation criteria such as relevance (to my inquiry), trustworthiness/credibility, and perspective to texts they encounter in the context of completing a project, and (b) that when students assume a critical stance toward text, their understanding and ability to use what they have learned is enhanced.

Conclusion

The theory and research discussed in this chapter point to promising practices for supporting students in developing the kinds of reading practices that engage real world dilemmas, seed cross-cultural competence, and have the potential to bring about a more just world through social action and global cooperation. What emerges from this review is a vision of students who, from a very young age, move beyond traditional forms of reading comprehension to ask about the implications of texts for how we view and act upon the world. Reading comprehension is reenvisioned in a way that brings social dilemmas and injustices (alluded to, countered in, or raised by texts) to the fore and treats them as problems to be solved, rather than distant or unsolvable inevitabilities. It invites students to consider the commonality and connectedness of human experience, including but not limited to the worlds that students encounter on paper and on the screen.

More research is needed to guide this work. As we noted at the outset, there is very little research on the pedagogy, and even less on the efficacy, of various approaches to preparing students to enact the text user/analyst and text critic roles. Moreover, this new research must attend to variation in the characteristics of students, texts, and contexts. Even more important, we need to know what students can do when critical approaches become the norm rather than the one-off exception (they get it from a single teacher or for a weeklong unit in January).

Several pedagogical themes rise to the top—problem posing around text, engaging in rich discussions about the construction of the world in texts, using perspective taking to understand the experiences of others, and evaluating the trustworthiness of texts. Even so, much remains to be learned about the educational experiences that build these practices: What kinds of texts evoke critical conversations at different developmental levels? How can teachers guide students into these ways of reading and reasoning? How will students know whether the evidence they have gathered is convincing in supporting their case?

We also need to better understand the outcomes of this kind of instruction. This requires comprehension researchers to envision, develop, and validate a wider range of outcomes. Possible outcomes must include critical and intertextual reasoning with text, evidence of considering multiple perspectives, and, perhaps most important, evidence of transfer to the ways that students read, engage with digital media, and act outside of school. Longitudinal research is also needed to document whether this kind of textual work produces tangible outcomes for individuals and communities who enact them as a matter of everyday cultural practice.

One possible implication of this review is the addition of a fifth reader role: the text actor. This proposed role builds on the text user/analyst and text critic by envisioning a reader who uses text to inspire and inform social action in alignment with the aspirations of critical literacy. Students take on this role when they come to see themselves as having agency to change the world and when they use reading (and other literacy skills) to produce tangible actions toward positive changes in their communities, as did the students in the Curwen et al. (2019) study. This role builds on a wealth of international scholarship describing a global and decolonizing approach to education, especially in the areas of social studies and civics (e.g., Abdi et al., 2015; Andreotti and de Souza, 2011). For example, Silva (2016) describes a first grade class in which the teacher guided students to engage in actions, inspired by

their readings, around environmental justice. Students created materials to encourage their neighbors to recycle and compost. The text actor asks, what perspectives, policies, and practices need to change in order to address the social problems raised by this text? How can I take action to produce meaningful change? This role offers a view of reading instruction that positions the ultimate ends of the instruction as the development of engaged citizens who use text as a resource for problem-solving and participation. In other words the job of comprehension for troubled times is not finished until that comprehension informs and catalyzes action toward a safer and more just global community.

This chapter describes an approach to collaborative learning called Collaborative Reasoning that facilitates the simultaneous development of language and thought. Collaborative learning generally refers to “a coordinated, synchronous activity that is the result of a continued attempt to construct and maintain a shared conception of a problem” among a group of people (Roschelle and Teasley, 1995, p. 70). Collaborative learning creates a social setting that involves life-like problems and challenging learning tasks for students to develop and practice language and thinking skills. Compared to teacher-centered learning, where students have little control over when they can speak and what they speak about, collaborative learning offers students more autonomy in how they approach problem solving, as well as opportunities to evaluate their own thinking, rather than depending on the teacher to evaluate their contributions (Dillenbourg et al., 2009).

In teacher-centered environments, language and thinking are often viewed separately and taught from different angles. The typical approach to language teaching is to facilitate the acquisition of pronunciation, spelling, rules of grammar, vocabulary, syntax, and pragmatics, especially when the students are bilingual learners (August et al., 2014). Teacher-led direct instruction predominates in language teaching throughout the world due to its efficiency and perceived effectiveness (Adams and Engelmann, 1996; Chall, 2000; Hattie, 2009). It is common for students to recite words, complete grammar exercises, produce monologues, and enact short dialogs presented in the textbook, without ever actually engaging in social interaction (Michaels et al., 2010).

Similar practices are observed in the teaching of thinking skills. Cognitive skills are usually taught in elementary and secondary classrooms by having students solve well-structured close-ended problems, repeat a set of routine procedures, or practice the “transfer of knowledge” from one form of standardized test to another (Stigler and Hiebert, 2000).

A commonsensical, but dubious assumption is that students will be able to think and reason well once they have acquired basic language skills. Thinking and reasoning, however, do not necessarily improve with the growth in basic elements of language. Cummins (1979) found that, even after a person had become proficient in basic interpersonal communication, it usually takes another 3–5 years for them to be able to understand content knowledge and express academic ideas.

According to sociocultural theory, thinking is developed through the internalization of social practices (Vygotsky, 1978). Language plays an important role during the socializing practice of thinking. It provides the rudimentary tool for people to express themselves and engage in dialogs with more competent others so that they can complete tasks beyond their current developmental levels (Vygotsky, 1978). Sociocultural theory emphasizes that the ultimate goal of learning is not to pass tests in school but to become competent members of a community of practice (Lave and Wenger, 1991), and therefore “their [teachers’] effort was not just to teach the same things more effectively, but to have knowing be a product of the students’ individual and social intellectual activity” (Greeno, 1989, p. 137).

Collaborative learning has been shown to provide an environment where language and thinking can develop simultaneously. Three decades of research on collaborative learning has demonstrated its benefits in promoting students’ deep comprehension of

texts, language production, and a variety of higher-order thinking and reasoning skills (Mercer and Dawes, 2008; Murphy et al., 2009; Resnick and Schantz, 2015; Reznitskaya et al., 2009). To explore how collaborative learning fosters children's development of language and thinking, this chapter introduces a specific learning format called *Collaborative Reasoning* (CR). In the following sections, we describe key characteristics of CR, review studies that document the effects of CR on children's language and thinking, and discuss the mechanism by which collaborative learning could foster the development of language and thought simultaneously.

Collaborative Reasoning: a new learning format

Collaborative Reasoning is a special form of collaborative learning that consists of open discussion of significant, controversial issues managed by students themselves (Anderson et al., 1998). Students in a small group, normally between five to eight students, read a short story together and then have a discussion of a Big Question based on the story. The Big Question presents a dilemma that does not have immediate right or wrong answers. The dilemma involves a practical, ethical, or socio-scientific issue, such as whether zoos are good places for animals or whether a grizzly bear that has hurt a visitor to a National Park should be put down. Students are encouraged to argue for their position on the issue, use evidence from the story or life experience to support their arguments, and present counter-arguments to challenge their peers' positions or rebuttals to defend their own positions. They are expected to listen carefully to each other, challenge each other respectfully, and engage everyone in the group throughout the discussion.

An important finding is that child leaders emerge who help groups have socially satisfying and intellectually productive discussions. Li et al. (2007) identified five types of leadership moves in children's CR discussions: turn management, argument development, planning and organizing, topic control, and acknowledgment. These moves have been observed among elementary school children in the United States (Li et al., 2007), as well as children in China (Gao et al., 2015). The different types of leadership moves serve as building blocks of the leadership schema (Li et al., 2007), through which children learn to understand the social structure of collaborative groups, the roles fulfilled by different group members, the function of leadership moves, the complementary relationship between leading and following, and the resolution of conflicts during interaction.

As children take on the major responsibility for regulating their own discussions, teachers step away from being the center of the classroom and instead become discussion facilitators. They can prompt students to explain or clarify their positions, elaborate their ideas with details and evidence from text or personal experiences, or acknowledge students' ideas or appropriate social and collaborative manners (Chinn et al., 2001). In addition to facilitating discussions, teachers play a major role in reminding students of the discussion norms at the beginning, and at the end debriefing students through group reflection on what went well during the discussion, and what could be changed for the better (Baker et al., 2017). This reflection involves students' active critique of the content of the discussion as well as the manner through which they engaged with each other.

Initially developed in the United States, CR has been implemented successfully in several Asian countries—China, South Korea, and Malaysia. Despite cultural differences, children everywhere seem to be able to quickly adapt to this new collaborative learning format and enjoy the freedom in reasoning with peers.

How Collaborative Reasoning promotes the development of language

A body of research has shown that CR promotes children's development of various aspects of language including listening comprehension, reading comprehension, speaking and writing proficiency, language coherence, academic vocabulary, and pragmatic awareness.

Listening and reading comprehension

In a study involving 75 fifth-grade Spanish-speaking English language learners from a low-income school district in the United States, Zhang and her colleagues found significant improvement in listening comprehension and reading comprehension after the children had eight CR discussions during a four-week instructional intervention (Zhang et al., 2013). A similar study was conducted with 106 fourth-graders from working-class families in China (Cheng et al., 2015). Children's performance on a reading comprehension test (Progress in International Reading Literacy Study; PIRLS) was examined before and after the children participated in eight CR discussions. The results showed that children in collaborative groups were superior in evaluating and analyzing information as compared control students who continued recitation-based instruction. Students did not differ in recalling information or making simple inferences. These studies indicate that CR improves children's in-depth processing of information and higher-level reading comprehension.

Speaking and writing proficiency

After participating in CR, children produce a larger volume of language, produce longer words, generate a greater variety of words, and use more complex syntax in spoken and written language, all suggesting higher expressive language proficiency. Zhang et al. (2013) study found that bilingual children used more complex English syntax in their oral narratives and produced more diverse English vocabulary in their reflective essays after participating in CR discussions. Cheng et al. (2015) found that the volume, complexity, and fluency of students' oral Chinese all significantly increased from the first to the last CR discussion. Ma'rof (2014) investigated the oral and written English of 430 eight-grade Malaysian students whose home languages included Chinese,

Tamil (a language of south India), or Indonesian, as well as Malaysian. After six weeks of whole class discussions or small-group CR discussions in English, students who had small-group CR discussions showed significantly better English reading fluency, increased oral and written English production, as well as greater English syntactic complexity and vocabulary diversity. Across several studies CR has enhanced children's language skills regardless of whether they were speaking their first language, learning a second language, or they were limited by scarce resources at home and school.

Language coherence

The coherence of students' talk and writing, as indicated by their use of logical conjunctions and other coordinating words and phrases, increases after participating in CR discussions. A connective serves as the bridge to tie together different ideas. For example, children use logical or causal connectives (e.g., *because, if, so, so that*) to indicate causal relationships between arguments, and analogical or hypothetical connectives (e.g., *just like, what if, so as*) to compare two scenarios or map prior knowledge to new information (Lin et al., 2015). Morris et al. (2018) conducted a discourse analysis to examine children's use of logical conjunctions in classroom dialog. They found that logical connectives were five times more frequent in CR discussion dialog than recitation discourse on the same topic in comparable classrooms. The results indicate that children's talk is more complex and connected during CR discussion as compared to teacher-managed instruction.

Academic vocabulary

Children's development of language is manifested in gains in their ability to make productive use of advanced and abstract vocabulary. *Productive use* means children can employ the words when talking or writing, not just choose correct answers to multiple-choice questions. An important type of advanced vocabulary is *general academic vocabulary*, words used in many disciplines that are uncommon in ordinary conversation. Ma et al. (2017b) investigated children's spontaneous productive use of academic vocabulary. The results indicated that students who had six-weeks of CR discussions produced more general academic words, such as *increase, reduce, and protect*, in an oral interview on a different topic which they had not studied than students who studied the same curriculum via teacher-led direct instruction for six weeks. The difference could be traced to the fact that students in collaborative groups had abundant practice using academic vocabulary words during CR discussions.

Pan et al. (2020) further investigated the role of collaborative discussion in children's acquisition and productive use of general academic vocabulary words. Multilevel logistic regression analyses with crossed random factors involving 229 fifth graders and 325 words showed that the general academic vocabulary words children employed when writing essays was directly related to the frequency the child and the child's peers used the words during discussions, after controlling for prior knowledge of the words, the frequency of the words in the instructional materials, and the children's reading level. Thus, the reason that children were able to produce more academic vocabulary after having CR discussions is that they learned the words by listening to their classmates use the words and then using the words themselves.

Pragmatic awareness

Latawiec et al. (2016) investigated children's use of metadiscourse in reflective essays they wrote after participating in CR discussions. Metadiscourse refers to "how we use language out of consideration for our readers or hearers based on our estimation of how best we can help them process and comprehend what we are saying" (Hyland, 2017, p. 17). Metadiscourse is using linguistic markers to organize what you have to say and convey accurate meanings to your audience. Latawiec et al. (2016) found that children in collaborative groups "have greater concern for how readers will take their arguments and greater appropriation of argument-enhancing formal elements," while students who experienced teacher-led recitation "more frequently linked propositions together with simple additive conjunctions" (Latawiec et al., 2016, p. 23). This result suggests that CR students have developed a better sense of pragmatics and more awareness of effective communication.

How Collaborative Reasoning promotes the development of thought

We have elaborated on the impact of Collaborative Reasoning on children's development of language. A commonly asked question is—does language proficiency constrain one's development of thinking? Language is conventionally regarded as the symbolic expression of thought, so although language skills are considered to provide the means for an individual to express thoughts and ideas, thought is not necessarily limited by impoverished language. Several studies have shown that CR improves children's development of higher-order thinking and reasoning skills including argumentative reasoning, analogical reasoning, and multilink causal reasoning, and even children low on measures of language proficiency are able to transfer these forms of reasoning to other contexts.

Argumentative reasoning

Students' argumentation skills significantly improve during CR discussions (Reznitskaya et al., 2009). Children take positions, draw evidence from reading materials, provide reasons and justifications, and defend their positions with counterarguments and rebuttals. Students establish their own argument strategies or emulate other people's argument moves during CR discussions. Improvement in skills of argument has been documented with Chinese and Korean students (Dong et al., 2008; Kim et al., 2011) and Spanish-speaking English language learners (Zhang et al., 2013) as well as mainstream American children. Skill in argumentation has been found to snowball within groups and transfer between different contexts, which suggests the development of an argument

schema (Anderson et al., 2001). Children are able to transfer the skills of argument they learn in CR discussions to independent essay writing on a topic they have not discussed (Dong et al., 2008; Kim et al., 2011; Reznitskaya et al., 2001).

The open participation structure of CR discussions helps to ensure that students socialize their thinking. Students adopt such argument stratagems as "What do you think, [CLASSMATE]?" to maintain participation equity (Anderson et al., 2001). Those who are shy and reluctant to give their position in front of the whole group have more chances to speak due to encouragement from emergent child leaders (Li et al., 2007; Sun et al., 2017). When the students themselves have control over turn taking and topic, they are more likely to develop a sense of agency and engage in self-directed thinking and reasoning (Sun et al., 2021).

Analogical reasoning

In addition to learning argument skills, CR discussions accelerate children's ability to use analogies to validate their viewpoints. Analogical reasoning refers to establishing relationships between apparently dissimilar concepts based on overlapping deep structure. Lin et al. (2012) analyzed the dialog in 54 CR discussions and found that children's analogical reasoning grew steadily from the first to ninth CR discussion both in quantity and quality. The frequency of novel analogies increased within discussions and previously-used analogies were adopted by others once generated by innovative children (Lin et al., 2012). The growth of analogical reasoning and the spread of analogies within discussion groups suggest that children improved their ability to recognize structural similarities between different concepts.

Multilink causal reasoning

Not only does CR promote children's understanding of structural similarities among different concepts, it enhances their ability to connect concepts into interlocking causal chains, an ability we call *multi-link causal reasoning* (Ma et al., 2017a). Compared to students who were taught through teachers' direct instruction, students who participated in CR discussions created more causal chains and longer causal chains in independent writing about the topic they had studied for six weeks. A similar pattern was found in a near-transfer task, in which students were interviewed about a different but conceptually related topic. Analysis of the interviews showed that students in the CR condition generated longer causal chains and were more likely to identify causal relations and relational concepts (Ma et al., 2021; Ma and Anderson, 2015). In a far-transfer task, students were asked to tell a story based on a picture book, a task that involved no conceptual overlap with the topic students had studied for six weeks. Children who participated in CR discussions connected the successive events in the pictures into a coherent story based on the causal relationships, while children who received direct instruction made fewer attempts to link successive events and simply described the story scenes shown on each picture (Ma et al., 2017a).

Transfer of thinking and reasoning

Besides multi-link reasoning, students have also been able to transfer other higher-order thinking skills developed in CR, including decision-making and creative problem solving, in post-CR activities. Decision making has been defined as "the process of making choices among competing courses of action" (Beyth-Marom et al., 1991, p. 20). Zhang et al. (2016) examined children's decision-making ability in reflective essay written after experiencing a socio-scientific curriculum about wolf management through CR discussions. Compared to students in direct instruction classrooms or uninstructed control classrooms, students in CR classrooms were more likely to write individual essays that recognized more than one side of a dilemma, considered a greater variety of reasons, and weighed the relative importance of competing reasons. These findings suggest that as a result of participating in CR discussions children acquire competencies in analyzing the pros and cons of different options in the process of making moral decisions or public policy decisions.

While writing a reflective essay about a dilemma resembles what is required of active participants in a CR discussion of a controversial issue, Sun et al. (2017) investigated 252 fifth graders from mid-east China solving non-routine math problems, a process with few obvious features in common with CR discussions of moral and practical dilemmas. Nonetheless, students who had CR discussions before solving the math problems produced significantly better problem solutions than comparable control peers and had more positive feelings toward the problem-solving experience (Sun et al., 2017). The explanation was that children acquired leadership skills from participating in the CR discussions that are needed for harmonious and productive group work, and that they were able to employ these skills in navigating the cooperative problem-solving activity. Effective leadership served as a mediator for groups to reach better problem solutions.

In another study enrolling 474 seventh-grade students from a rural middle school in northern China, Ma and Zhou (2021) found that students who participated in an eight-day instructional intervention infused with CR discussions performed better in a creative problem-solving task than students in the control group. CR students proposed more solutions than those in the control group, offered a greater variety of solutions, and their solutions were more distinctive and judged to be more useful in a real-life situation. Collaborative Reasoning promoted children's creative solutions to social problems, suggesting that the experience of socializing with peers through CR may improve their ability to deal with social conflict in real life (Lin et al., 2022).

To summarize, during CR discussions, students freely express their views about the best answer to the Big Question and generate reasons to support their views. They challenge the reasoning of others in several ways, such as by asking clarification questions to promote further thinking when others' arguments seem incomplete or problematic. CR facilitates the emergence of novel ideas by providing ample opportunities for the social exchange of ideas among children, which improves their ability to generate solutions to several kinds of problems. Children are encouraged to draw on their own experiences, which probably facilitates the reconstruction of their mental models. Children learn to consider multiple points of view and weigh the pros and cons before making choices.

The social mechanism of Collaborative Reasoning

We have elaborated on the impact of CR on children's development of language and thinking separately. In this section we will consider the two facets of development together. We will attempt to explain the social mechanism of collaborative learning that fosters the development of language and thought, using CR discussion as one particular context for development. Our thinking is that language is fundamentally designed for interpersonal communication, and opportunities for interpersonal communication are maximized during collaborative discussions with peers.

In his sociocultural theory, Vygotsky proposed the concept of "zone of proximal development," which describes the difference between a person's actual developmental level and their potential developmental level that may be achieved with the help of others (Vygotsky, 1978). In this process of CR discussions, children receive guidance from more competent agents (e.g., peers with higher language proficiency as well, of course, as from their teachers and in other contexts from their parents) and gradually internalize it, making it distinctively their own. As a result, children develop their own ways of using a language and construct their personal understanding of the world through internalizing the conversations from the social cultural environment. During CR, this socialization process has several features that may contribute to children's rapid development of language and thought, including the free and open format of discussion, the exploratory nature of talk, the constructive interaction among people with different expertise, and the guided participation scaffolded by more competent peers and occasionally by adults. We will elaborate each feature below.

CR fosters a zone of proximal development

First of all, CR creates an open social context for children to exchange language and thoughts. Unlike traditional teacher-led instruction in which children are following steps established by the teachers to solve problems, CR naturally forms a zone of proximal development. The problems that children encounter in CR do not have definite answers or predetermined solutions, so they have to rely on each other to solve the problems. Hatano and Inagaki (1984) identified two types of expertise in learning: routine expertise and adaptive expertise. Routine expertise enables a learner to perform a task following well-structured procedures or a set of predetermined rules; whereas adaptive expertise refers to the ability to flexibly transfer what has been acquired in the past to new situations through accommodation and integration (Hatano and Inagaki, 1984). The process of solving an open-format, non-routine problem involves a series of high-level mental operations, such as retrieving relevant background knowledge, generating initial hypothesis, developing procedures to test hypothesis, drawing conclusion from the results of these procedures, and if necessary, revisiting the initial hypothesis to evaluate the results (Hmelo-Silver and DeSimone, 2013). The open-format of CR discussions enables children to constantly reflect on their thinking and modify these thoughts and ideas based on other people's inputs. Through socializing with others, children are able to develop a better understanding of the problem and accommodate what they know to the current uncertain situation.

CR creates opportunities for exploratory talk

Second, children have the opportunity to engage in "exploratory talk" during CR discussions, instead of having "cumulative talk" or "disputational talk." Disputational talk refers to the situation when speakers cannot reach an agreement but have to end up with individual decision making. Cumulative talk is the opposite; it means that speakers agree on the same opinion without critically responding to each other's thinking. During CR discussions, information is shared with everyone in the group and every member takes responsibility for decision making (Anderson et al., 2001; Chinn et al., 2001; Reznitskaya et al., 2009). Speakers in CR discussions "engage critically but constructively with each other's ideas" (Mercer, 2004, p. 146), which indicates the exploratory nature of the talk. Exploratory talk provides stimulates the socialization of thinking, and enables children to incorporate external information into existing schemas.

CR promotes collaborative learning

Third, CR creates an environment for children with different areas of expertise to communicate freely and interact constructively. Vygotsky (1978) believed that people are more likely to complete tasks that they cannot accomplish independently when they collaborate with more capable others. Previous studies have compared the situation of children completing complex tasks alone or completing tasks with others, and found that children who complete tasks in collaboration with others perform better than children who complete tasks alone (Azmitia, 1988; Fawcett and Garton, 2005). Following peers' modeling and explanation, students with lower academic competency are able to engage in higher-level thinking. When reminded of gaps, inconsistencies, or misconceptions in their statements, students have the chance to revise their original thinking. In collaborative learning, children with low-competency may spontaneously use their high-ability peers as a resource, asking them for help or confirming whether their thinking is on the right track (Garton and Pratt, 2001). Through constructive interaction, children often are able to incorporate complex language forms used by linguistically more advanced students, and internalize higher-order thinking and reasoning skills modeled by more competent peers.

CR engages students and teachers in the social exchange of ideas

Finally, teachers guide and support students participating in CR discussions, rather than talking a lot themselves. In CR discussions, teacher's role is not to cover the content knowledge, but to promote students' thinking and reasoning. Teachers' instructional moves include: [1] prompting for position, reason, evidence, clarification, alternative perspective, or counterarguments; [2] modeling the process of making arguments, defending positions, or challenging other people's opinions so that students learn ways to articulate

their thinking; [3] encouraging students to express their opinions freely and to challenge each other when they have a different opinion; [4] giving students the freedom to decide what to say and when they can say it; [5] bringing up unexplored topics, [6] challenging when the group too quickly reaches a consensus or only considers one side of an argument; and [7] summing up what has been said and how the argument has developed so that the group members can maintain a shared understanding (Chinn et al., 2001; Nguyen-Jahiel et al., 2007). With these instructional moves, teachers provide scaffolding as needed while maintaining students' autonomy to regulate their own learning.

We need to emphasize that teachers do not talk very much during CR discussions. Sometimes a whole discussion can take place without the teacher saying a word. The discussion belongs to the children. When the discussion is going well the children are in charge and can do most things for themselves.

Conclusion

Research over the past three decades shows that participation with small groups of classmates in Collaborative Reasoning discussions improves various aspects of children's language and thought. Aspects of language that are enhanced include listening comprehension, reading comprehension, and proficiency in speaking and writing. Children acquire and are able productively use academic vocabulary words; they tell stories that are more complete and coherent; they write essays in which they mark relationships among ideas with connective words and phrases. Research studies demonstrate that CR improves children's higher-order thinking and reasoning, including promoting the habits of mind to formulate complete arguments; make decisions that consider both sides of issues, take into account many reasons, and weigh the importance of reasons; and construct chains of reasoning to envision possible consequences of courses of action. Even children low on measures of language proficiency are often able to acquire these forms of reasoning and transfer them to other contexts.

Remaking worlds

In a superhero storytelling project led by the authors, in a US midwestern middle school (ages 12–14), Kiana, Rene, Melissa, Lin and Aidan worked on building their superhero team. Each student had developed their own superhero, and Rene worked on drawing these superheroes on an iPad as the group thought through what their five superheroes might do in their neighborhood, the Mount, where their story was set. They talked about their superheroes heading to a different (real) neighborhood in their city, “where we go to get the best Halloween candy.” This led to a discussion of how the superheroes might trick or treat in their real superhero costumes. “I swear I’m cool,” Kiana noted, embodying her superhero.

Rene then changed the topic, “They should live in a universe where everyone has quirks and 30% of people do not have super-powers.” “Maybe we should make this like a fandom,” he mused. Aidan responded with a warning, “Do you know if we publish this we would not get paid a lot because it’s all five of us?”

Although at the time, we did not know what Rene was referencing in his mentions of “quirks,” we learned in exit interviews that the term was recycled from Rene’s deep knowledge of the Japanese anime and manga series and global franchise, *My Hero Academia* (MHA). The MHA storyworld posits a central character who, unlike most of his school-age peers, has no apparent superpower but begins to discover underlying strengths for resisting evil. Rene reported that he had been writing fanfiction about this series for a while on the platform, Wattpad, and that he had had over a thousand readers. “I like to create things in general,” Rene explained. “You decide how [the characters] act, what they do. It gives you a sense of power because you have control over the situation and stuff.”

Introduction

In their influential conceptualization of “restorying,” Thomas and Stornaouiolo (2016) identify six ways youth use fanfiction sites to critically and collectively revise the character representations of much loved stories such as *The Hunger Games* and *The Hobbit*, to better represent their identities as Brown and Black youth who want to feel present in these storyworlds. Thomas, for example, describes one youth’s practice of “race-bending” Galadriel, the magnificent elven queen from *The Lord of The Rings*, by using digital media tools to create an image of a dark brown-skin woman draped in a gem-filled robe. The image was posted to a fanfic website where she garnered praise for the beauty of her design. Similarly, youth in the vignette above extend their pleasure in viewing MHA

from knowing every detail of the original characters' personalities and powers to creating their own anime characters whose inner and outer conflicts reflect who they are in a school and society that often denies or threatens their differences.

As illustrated by these examples, restorying entails "a participatory textual practice in which young people use new media tools to inscribe themselves into existence" (Thomas and Stornaoui p. 313). Drawing on Rosenblatt's (1978) transactional theory of literary reading, restorying centers readers as story makers, whose references to their intertextual and multi-sensory knowledge, experiences, and multi-modal meaning-making bring stories to life, under guidance by the text. Whether the text is presented as an oral history, counterstory (Solorzano and Yosso, 2001), folktale, joke, meme, novel, comic, manga, picturebook, audio book, anime, YouTube video, or film, today's youth are using digital tools, expansive content, and transmedial platforms to support their drive to read, remake, and be recognized within and beyond the narratives they value.

In this chapter, we highlight research with youth whose participatory textual practices may be understood as both restorying and, within a broader sociocultural framework of interpretation and cultural production, as enactments of critical imagination. Scholars and educators who study children's and young adults' interpretations of literature and related story forms have long recognized that imagination underwrites readers' and storytellers' play with and transformations of meaning and language as they shape and reshape story worlds, and simultaneously transform their sense of self among others (Dyson, 1996; Enciso, 1994, 2003; Hooks, 1991; Winn, 2010). As early as the 1930s, Vygotsky proposed that play and imagination are necessary for displacing or releasing the immediate material and social reality so that a new temporary world might be evoked. He recognized that just as children must be able to displace reality in order to create new meanings about the world through improvised play, they must also regard abstract symbols as representations for images, actions, and feelings in order to create meaning from texts. Further, story interpretations are a form of improvised meaning-making. As Smagorinsky (2001) notes, Vygotsky (1987) understood that literary experiences cannot be predetermined or finalized but rather sensed, initially, as a "cloud of meaning" expressed and transformed through a "shower of words" (Vygotsky, 1987, p. 281). Literacy, in this view, entails constant movement between symbols and lived experiences, subject to historically formed meanings and relations of power throughout the interpretive process (Bakhtin, 2010). As a ubiquitous and transformative cultural practice, however, imagination is not well understood or explicitly figured into literary response theories and story making pedagogies. Along with Rosenblatt's transactional theory, restorying is one of the clearest conceptualizations of imagination-in-action through which youth use the gaps in representation to not only complete a text but also displace dominant images by using digital and analog tools to experiment and play with whom they might become within a wide range of textual storylines, characters, and settings.

In the following sections, we draw on contemporary sociocultural theory, including transformative activist theories of imagination to outline key features of imagination in literature and literacy education and its critical potential for youth's opportunities to author their own worlds. Throughout, we highlight research that illustrates youth story reading and story making as critical imagination and restorying practices. We categorize these studies in relation to three overarching processes in story reading and story making: (1) world building (2) perspective taking and positioning and (3) language play. We conclude with proposals for centering critical imagination in literature education and research.

Critical imagination, play and figured worlds

In this section we describe foundational theories of imagination (Vygotsky, 2004), figured worlds (Holland et al., 2001) and play (Vygotsky, 2004) and we explain the interrelation between these critical sociocultural processes and Stetsenko's (2017) transformative extension of Vygotskian theory. We then explain why an understanding of literary reading should be expanded to encompass imagination and critical sociocultural processes in theory building and pedagogy.

Uncertainty and imagination

In Vygotsky's (2004) sociocultural theory of change, imagination is at the center of the production of all cultural life. In this view, imagination is not a practice of conjuring something out of nothing in service of creative performance, but rather an ongoing effort to resolve the dissonances that arise in everyday events, images, or meanings (Pelaprat and Cole, 2011). When we are faced with uncertainty or ambiguity, or differences in the socially constructed meanings about who we are, whether in storytelling or everyday life, we experience a pause (in microseconds or longer) during which we "fill the gap" with culturally-historically formed meanings, images, experiences, and projections of what has been and what might be possible—as disruptions of presumed colonizing continuities from past to present to future social conditions (Pelaprat and Cole, 2011; Torres and Medina, 2021; Zuckerman, 2021). Similarly, Rosenblatt and other literary scholars have argued that the indeterminacy of language and the necessarily incomplete representation of life in stories, create openings or gaps to be elaborated on by readers (Herman, 2009; Iser, 1972; Suleiman and Crosman, 2014). Stories, in this sense, unsettle what is taken for granted by proposing alternative visions of past and future landscapes, by allowing us to consider "what if" and "what might be" as characters face decisions and readers, alongside characters, pause to consider the implications of different actions for their own humanity (Bruner, 1986).

Figured worlds

Disrupting worlds through narrative speculation may also be understood through the concept of figured worlds, developed by Holland et al. (2001) in their ethnographic studies of improvisational action and the use of mediating artifacts that introduce change in taken for granted daily interactions. Holland et al., argue that our lives are “figured” by our own and others’ ongoing participation in accepted ways of talking about, relating to, narrating, and interpreting events:

By “figured world” we mean a socially and culturally constructed realm of interpretation in which particular characters and actors are recognized, significance is assigned to certain acts, and particular outcomes are valued over others. These collective “as-if” worlds ... mediate behavior and ... inform participants’ outlooks (p. 32).

Although figured worlds inform participants’ outlooks and may appear to be thoroughly predictable and stable, all parts of the constructed “as if” realm are also open to improvisation and change. As Rene suggests in the opening vignette, beyond the figured world of school-based literature education in which he might be presumed to be a passive learner who has yet to acquire interpretive skills, he can be seen as a popular fanfiction author in the figured worlds of fandom and peer story making where innovations and risk-taking are valued.

Play and figured worlds

Holland et al. (2001) align with Vygotsky’s analysis of play as a primary practice for freeing ourselves from the material constraints of the present, “in order to construct a new reality” (Vygotsky, 2004, p. 11). Through play, youth assert ambiguous meaning about their everyday relationships and ways of being seen by others. Play, however, is not an escape, but rather a way to examine reality by “staging” how the world works or by reworking parts of the world to discover what else might be possible. Vygotsky’s famous example of two children who are sisters, playing “sisters”, illustrates our human capacity to step outside of a figured world to both enjoy the doubled meaning of being and performing as ourselves, while also looking in on what “sisters” means within the boundaries of a figured world (Vygotsky, 2016). In Holland et al. (2001) words, practices of imagination and improvisation displace familiar fields of vision in service of an emerging figured world. Similarly, in their work with young children playing with popular media narratives, Medina and Wohlwend (2014) understand play as a practice of remediating their surroundings to create “as if” worlds “where alternative sets of premises make additional or contradictory identity texts possible” (p. 29).

Critical imagination and a transformative activist stance

Stetsenko’s (2017) scholarship on Vygotsky’s revolutionary theories of social-historical change magnifies the significance of contributing to new worlds, within moment to moment “gaps” and within play and narrative spaces. For Stetsenko, human development depends on orienting toward justice and diversity, toward our histories and our hopes for the future. A passive or unexamined participation in everyday life maintains oppressive relationships and social conditions. Stetsenko’s theory, defined overall as a “transformative activist stance” is a powerful description of youth agency as they move texts through possible meanings and worlds, with an intention to open more space for their own and others’ dignity, creativity, and visions for the future. As Lewis et al. (2021) argue, drawing on Enciso (2017, 2014, 2007) critical analysis of power and history in imagined futures, “imagination is not an individual, spontaneous act of free will, but is constrained by sociocultural conditions that open or close the meaning of artifacts, language, images, and social positions” (Lewis et al.; p. 153). Storytelling and storymaking fill these gaps through play and rehearsals of possible new relationships that forecast liberatory futures while contributing to potentially altered relations in the present.

Defining critical imagination in literary reading

Conceptualizing literary reading through the lens of critical imagination broadens the scope of how we understand youth’s play with and through the mediating means of texts. First it collapses the binary between the consumption and production of stories, by understanding literary reading as (re)shaping figured worlds. It acknowledges that students’ movements within and around stories is agentic work through which they may restory and replay dominant narratives and imagine alternate possibilities outside of these narratives. We argue that by opening up space to multiple narrative modes and platforms, literary study may offer youth the potential to be more agentic authors of their reading and actions in textual and societal contexts. Critical imagination permits a broad understanding of literary reading as a practice of deconstructing and reconstructing social realities and reconfiguring these realities through speculation and play with worlds, social positions, and language. We describe guiding research in these three areas (worlds, positions, and language) in the following sections. This review highlights the literacy practices students are already using to shift the ways their realities are represented and read, and argues that such practices should be at the center of literary instruction in schools.

World making

Youth not only read fiction but also use fiction to establish new routes through their everyday and imagined worlds. The opening vignette, for example, points to the storytellers' movements from an international franchise, MHA, to their own constructed story-world of superheroes and "quirks", and into a real neighborhood "where they get all the good Halloween candy." Here, youth are not only interpreting a beloved story world, but also annotating their everyday places and pathways. Moment to moment interactions and worldmaking among youth reveal the interplay of youth interests, concerns, and joys as they critically (re)imagine and restore the intersections of their everyday and fictional worlds. Literacy researchers have long recognized the power of youth to remake places and their identities through linguistic and symbolic means (Maira and Soep, 2004; Rogers et al., 2014). We focus, in the next section, on research that directly engages literary and other narrative forms for worldmaking.

World making for presence, belonging, and collective action

In our overview of worldmaking and critical imagination, we consider research with youth who are remaking narrative worlds, sometimes but not always facilitated by adults, in schools and communities, for purposes of (1) asserting their presence in story-worlds and related discourses of social life (2) deepening belonging in the present while projecting new social structures for possible futures and (3) constructing collective civic engagement through shared story fandom.

Asserting presence

In an international study of the intersections between children's immigrant experiences and their explorations of Shaun Tan's *The Arrival* (2007), Arizpe et al. (2014) invited children to talk together, draw, and question what it looks and feels like to be a newcomer, entering an unfamiliar world. Although the researchers were primarily concerned with documenting the many literary reading strategies and cultural resources children mobilize to construct rich interpretations of an image-rich, wordless novel, we are interested in the ways children speculated and built worlds together as they clarified and interrogated what it means to "be an immigrant." For example, in the USA-based research, Martinez-Roldán and Newcomer (2011) describe two students, Almah and Ryan's, drawing and storytelling as "performative narratives," during which they imagined themselves in places and times like those of the central character in *The Arrival*. Throughout their dialog about their own drawings and the detailed, surreal images of the world experienced by the book's central character, the two children listened to one another's descriptions and entered one another's imagined worlds to question the significance of details in one another's drawing, describe their feelings, and hypothesize about how the world of passports and offices and lines of people matter in the process of immigration. By inviting children to assert their presence in Tan's storyworld, the researchers assumed an opening or gap for critical imagination, where multiple possible futures were valued, potentially contributing to a fuller explanation of the motives and challenges faced by immigrants who are forced to follow often baffling (and violent) international policies and pathways to entry.

In a storytelling project similar to the one referenced in the opening event, Enciso and Krone (2022) proposed to a racially and ethnically diverse group of 12 and 13-year-olds that they create superhero stories set in their neighborhood, thus inviting youth to assert their presence in fantastic landscapes with imagined powerful resources, through their knowledge of the history and materiality of their streets. Drawing on their love of DC and anime, two project members, Lee and Sebro created an antihero and hero who battled one another across the long corridor of a main thoroughfare, cutting through their neighborhood, and leaving destruction in their wake, as well as hope for the end of gentrification. Lee described his character, Timeless, as an AI robot who made himself, "from the rejected cars, parts, and tore up buildings he scrounges from highway ditches, alleys, and junkyards." Lee seems to imagine his character at the intersection of the pathways between his material experience of the past and the possibility of future equity and change. This is one of multiple stories created by youth over 3 years, as they returned almost weekly to elaborate on their local stories, by reaching for and referencing their extensive knowledge of superhero narratives. The adults in this study actively introduced and sustained a practice of critical imagination among youth by referring to the youth as authors and artists who were contributing to the creative environment of a writers' room in the service of creating superhero stories for their community. For example, instead of asking if youth had finished their scene or character portrait, adults would invite youth to summarize last week's work and ask what they wanted to develop during the current session. Adults would also scribe youth ideas; a practice that lowered adult status and freed youth to focus on ideas rather than the mechanics of recording and editing. Adults' respect for youth knowledge and creativity supported their capacities to narrate their everyday worlds as they also referenced stories they most enjoyed while developing the themes of friendship, mutual care, safety, community stability, and mental health.

Belonging in possible futures

Through practices of critical imagination, "a play world may be taken, ultimately and profoundly, into the "real world", to shape the sites of everyday activity" (Holland et al., 2001, p. 239). By moving through the everyday world, with storytelling as a guide and resource for valuing and projecting future care and strength, youth and adults have been able to collectively build intergenerational knowledge and an orientation to self- and community love (Anzaldúa, 2004; Rowell and Butler, 1997; Woodson, 2003). Two recent research projects exemplify worldmaking for belonging in possible futures.

Literature and education scholar, Toliver (2020, 2021a,b,c), has studied the extensive philosophies and projected futures of Black women who have created poetry, dance, literature and music to understand and elevate their vision of survival and thriving despite the persistence of anti-Black violence. Toliver situates and facilitates young Black girls' storytelling (2020, 2021a,b) in

relation with the works of Black feminist and Afrofuturist writers whose stories engaged them in creating counterstories within “an experiential portal that guides readers to reflect on the current state of the world, to hypothesize about the trajectory of society, and to challenge any possible future that continues the subjugation of Black people” (2021a,b,c; p. 132). In her research with Black girls, Toliver sustains a space for their movement between a figured order of racial hierarchy and what is imaginable and actionable beyond these figurations. Toliver recognizes that, “stories ... are a means to reaffirm the humanity of the storyteller because they share their lives with those willing to listen” (2020, p. 1). “Ultimately,” she continues, “the Black narrative tradition imbues truth in the tale, as Black storytellers draw from history, real-life experience, personal feeling, and imagination to create intricate testimonies for their listeners to witness” (Toliver, 2021a,b, p. 2). For Toliver, the relationships among teller, present adults, and storied listeners and witnesses make possible a sacred space for youth to imagine themselves into a future where Blackness, across time, is loved and fully alive in a society designed exquisitely by them for their belonging and freedom.

The second study is described by the author, Medina (2021), as a “(re)membering” (Dillard, 2012) of her own embodied explorations and performances of possible decolonial Puerto Rican futures alongside the anticolonial literacy work of young artist activists “who use their arts to enact, re-create, and theorize with hidden and marginalized knowledges ... through playful engagements with social realities” (p. 137). Medina describes the improvisational performance of a well-known Puerto Rican youth troupe, Jóvenes del 98, as they deconstruct capitalist and evangelical Christian discourses that reinforce practices of colonizing and subjugating decolonial histories and voices. Working as both a memoirist of her own artist/activist identities and as a chronicler of the troupe’s improvisations, Medina shows how youth constructed a montage of episodes, prayers, pronouncements, and projections that drew on colonial and neoliberal social discourses while keeping open the interpretive space through which their embodied, critical imagining and knowledge of colonial and decolonial worlds could collide, rearrange, and thoroughly disrupt “the complex social ecology and trajectories of colonialities” (p. 151). Like other scholar-artist-activists (Sealey-Ruíz, 2020; Dillard, 2021), Medina’s research exemplifies the necessary excavation of educators’ personal ways of knowing and unknowing, through our embodied experiences of the colonizing discourses and materialities we seek to disrupt. By creating a (re)membered story of improvisation, Medina illustrates the labor and pleasure of not only naming but embodying stories, as we improvise our ways into belonging in more equitable and just possible futures.

Collective engagement in digital worldmaking

Youths’ agency as world makers through digital tools and platforms has been the subject of international literature and literacy studies for more than two decades (De Kloet and Fung, 2016; Knobel and Lankshear, 2008; Koh and Benson, 2011; Lewis and Fabos, 2000; Maira and Soep, 2004; Pathak-Shelat and DeShano, 2014; Rogers et al., 2014; Stornaiuolo and Whitney, 2018). Scholars of popular media have closely followed the ways youth and adults have collectively developed platforms for extending stories, games, and films for their multi-layered, global immersive interaction (de Castell and Jenson, 2003) and, more recently, for repurposing their fandom for civic imagination and engagement (Jenkins et al., 2020). Several international projects have recognized youth fandom as a collective and connected practice for organizing social justice initiatives (Ito et al., 2015). One of the more striking, literature-based online collectives, named the Harry Potter Alliance (recently renamed Fandom Forward), was initiated by fans who used their affinity for the Harry Potter series to “bring together narrative elements from social justice and the Harry Potter content world. For example, their annual book drive to support libraries is called ‘Accio Books,’ referencing a charm in the Harry Potter story that summons objects from a distance” (Ito et al.; p. 18). Their website also provides toolkits in support of campaigns to address “voting, body image, marriage equality, fair trade, literacy, child slavery, disaster relief, and hunger” (p. 20).

Working with the idea of “hacking” and “remixing” storyworlds, Dando et al. (2019) developed an 8-week project with five New York City high school girls of color who were assisted by Black and African diaspora “professional artists, designers and educators to develop tangible artifacts that critically imagine a future” (p. 157) that, as many authors of comics, plays, and films have done, rewrite the legacy of white supremacy. The focus of their redesign was Wakanda, the fictional, Afrofuturist home of the uncolonized and highly technologically, politically and artistically sophisticated African people featured in the Black Panther comics. The project leaders and artists invited participants “to create their Wakanda—to bring histories, family experiences, art, textiles, style, and technology together to create a new home that would address the problems they face and elevate the values they espouse” (p. 158). Throughout the project, the girls read, listened to music and participated in discussions about Black artistic and cultural expression, and began creating medallions that symbolized their understanding of complex cultural histories and trajectories within and projected beyond the everyday experiences of racism and colonization. Aida, a 15-year-old participant, used a 3-D tool to create a medallion that centered the continent of Africa with lines extending out to symbolize the connections that western societies should recognize. She also expressed anger about silences and the absence of voices, so that “they stay silent and the only people who really talk are the wealthy!” (p. 159). Dando et al. facilitated a project of worldmaking inspired by Wakanda’s images and ideology that clearly drew participants and artists together in a celebration of critical imagination, where playing with digital materials, artifacts, sound, symbols, and stories opened dialog, personal discovery and new forms of representation for inscribing the self into past, present and future collectives.

Summary

Practices of critical imagination reduce the pull of binaries and hierarchies, to create a space for exploring the possible relationships between textual storyworlds and everyday realities. Youth may mobilize their everyday resources, along with their political insights about inequities and injustices to create new ways of organizing for a future they want to bring forward. The three dimensions and related studies of worldmaking described here—asserting one’s presence, belonging in possible futures, and collective

engagement—illustrate the interdependent and overlapping ways youth and researchers value stories as speculative framings for refiguring ways of being understood in fictional and real worlds.

Positioning and repositioning

Attention to positioning in and through storyworlds, reveals the way stories momentarily free social actors from the constraints of the present, creating alternative identity trajectories. In the opening vignette, Kiana uses the space produced by the story to engage in such repositioning, as she briefly toggles into the first-person role of her superhero who is trick or treating in their superhero costume. “I swear I’m cool,” she playfully performed, speaking to an imagined person passing out candy. Aidan also plays with possible new positions as he projects a future in which this story is published and produced and students are valued as authors and creators. “Do you know if we publish this we would not get paid a lot because it’s all five of us?” Aidan cautioned. As noted above, it was only in exit interviews that we realized this position of published author was not a future projection, but rather something Rene was already stepping into the digital platform, Wattpad. Stories, this group suggests, open alternate positionings in not only imagined but also in material worlds.

Writing selves into texts

As students refigure worlds through story, they actively step into new positions, getting unstuck from static roles and categorizations. We highlight how students use stories and storytelling to construct new communities for themselves and others as they build windows (Sims-Bishop, 1990) into texts, new media, and school spaces. In addition to Thomas’ work on restorying (2016), her recent text, the *Dark Fantastic* (2020), describes how popular young adult literature and media like *The Vampire Diaries* and *The Hunger Games* narratively perpetuate violence and harm against particularly girls of color, using discriminatory tropes and practices from everyday life. However, Thomas also describes how fans are reshaping these literary worlds, using apps like Wattpad, to insert themselves into problematic storyworlds in ways that flip and counter this harm. Low’s (2017) study describes similar work students conducted in a “Comics Inquiry Community,” an after-school club in a Philadelphia school, where color-blindness was the norm. Low details how students’ talk about superheroes like Miles Morales in *Spiderman* and Kamala Khan in *Ms. Marvel* opened up discussions of race that had previously been silenced. In these discussions, students challenged the white male norm position in superhero texts and society and imagined new possibilities for whom gets to be a superhero, taking on interpretative positions as narrative creators and social agents. Both of these studies suggest that literary reading entails not only identifying the narrow subject positions available in dominant narratives and existing genres, but also deliberate work to form new textual subject positions that better represent readers’ desires, identities and experiences.

Rewriting spaces

Students may use storytelling and storyworlds to (re)position themselves in not only textual spaces but also school spaces that have historically excluded them. Campano et al. (2013) describe how students they worked with in an over-tested and over-surveilled elementary school used a variety of texts including Louis Sachar’s *Holes*, to assert their agency as “organic intellectuals” (Gramsci, 1971) who contested dehumanization and marginalization. These students shifted from critics to creators as they engaged in their own library-building projects that communicated different norms for justice and inclusion in their community. Johnson’s (2014, 2017) work also demonstrates how storytelling and writing may open safe spaces on the “edges” (2014) of school for students to share, explore, and affirm their identities. Working from her own position as a professor-in-residence at West High School, Johnson (2017) describes Writing@West, an elective program in which Black queer youth wrote about themselves in ways that were not supported in their academic coursework. Johnson describes students’ literary production in this elective course as epistemological and ontological, as students in this space shared stories that asserted their humanity and challenged dominant ways of knowing in school. In Writing@West, Johnson explains “students not only named their experiences, but were involved in rewriting a world where they could enact several aspects of their identities” (Johnson, 2017, p. 29). Literary study, in this view, actively attends to the world-making that occurs when students are invited to write themselves into texts and schools.

Repositioning through ruptures

Studies have also highlighted the potential of rhetorical ruptures or gaps in literary reading (Torres and Medina, 2021; Schey and Blackburn, 2019). Such gaps create disjunctures that challenge the sociocultural frameworks students use to make sense of both stories and worlds. Schey and Blackburn (2019) describe the experience of reading *Brooklyn, Burning*, with students in a LGBTQ themed literature course in a charter arts high school. Neither the main character in this text nor this character’s love interest is gendered, a rupture that, Schey and Blackburn argue, offered productive potential when students were supported in engaging in dialog to think through this gap. When the class gave sustained attention to this surprising textual feature, students began to shift their own positionalities by deconstructing dominant expectations around gender and sexuality both in and outside of this text. Like Schey and Blackburn, Torres and Medina (2021) analyze the transformative potential of textual ruptures. In their analysis of Puerto Rican children’s books about Hurricane Maria, they identify several literary devices and rhetorical patterns that challenge a western way of understanding this event and open decolonial readings of both Hurricane Maria and Puerto Rico broadly. While previous studies examine how students use texts to shift roles, these studies highlight how texts may push readers into new interpretative positions, encouraging them to imagine different ways of reading not only texts and characters but also worlds.

Language play

Within story spaces, words and signs are open to unexpected meanings and usages. For example, in our opening vignette, and throughout his larger storytelling Rene drew language from *My Hero Academia*, using elements like “quirks” from this textual universe as tools that he could add to and reshape in his own created world. As Rene noted in his exit interview, “I like to create things in general. You decide how [the characters] act and what they do. It gives you a sense of power because you have control over the situation and stuff.” In addition to readers’ practices of world-making and repositioning, we are interested in how youth broadly assume power over their circumstances by creating new meanings of words and signs within imagined storyworlds.

Freeing social signs

Youth use play to free social signs from previous meanings and propose new ones, refiguring worlds in the process. Conceptualizing what counts as literary work through the lens of critical imagination permits an attention to how youth are already engaging in such play in small scale acts of linguistic innovation and subversion. Following scholars who have highlighted the way young people creatively use and refashion language to challenge and bypass white western linguistic norms (Richardson, 2013; Baker-Bell, 2020; Martínez and Morales, 2014; Machado and Gonzales, 2020), we see the language play that happens within storytelling as literary work. Orellana’s (2016) work with B-Club, an after-school program grounded in sociocultural theories of imagination and play, exemplifies the relationship between language play and storytelling. Youth created norms, rules and routines for their space, creating opportunities for play and performance and for engaging in novel ways with each other and their material surroundings. Instead of conceptualizing literate activities as practice for a future assessment, students in B-club used language and stories to accomplish real action within their local and global communities. Within this space, Orellana points out the shifts in language and semiotics when students tried to get things done, using processes of critical imagination to meet real ends in the immediate future. Within this translingual, transcultural group, such shifts often took the form of translanguaging and working across and between linguistic borders. However, Orellana also indicates how material signs, like a detergent box became a soapbox for youth speakers, who adopted and performed new playful meanings for material and language within this space.

Figurative language

Figured world-making also has a relationship to the study of figurative language that has been a long-standing feature of literary reading in ELA classrooms. Studies have demonstrated youth’s figurative meanings may function as critical tools and that students’ esthetic transactions with literature hold sociopolitical weight (Cai, 2008; Lewis, 2000; Wissman, 2018). Following this work, we wonder how students are agentially reshaping language through figurative meanings and readings, challenging on a microscale, the larger frames or heuristics we use to read our worlds. A pivotal study in this area is Lee’s (2007) exploration of students’ literary reading in a Chicago area high school, where Lee and others instituted curricula based on principles of cultural modeling. Lee describes how the African American students she worked with already used figurative meaning-making practices in their everyday language and communication, a repertoire of linguistic and literate skills that she drew into students’ literary work. Working from this foundation, students in her classroom moved beyond literal meanings to open up figurative interpretations of language in texts that included Toni Morrison’s *Beloved*. Through figurative meaning-making students in this classroom shifted the frames their peers were employing to re-figure these textual worlds. Everett’s (2018) recent study of a summer writing program she facilitated for high school students on critical metaphor also describes how youth use figurative language to shift readings of their worlds. Everett focuses on one student, Shawn, who purposefully used metaphor to critique the school to prison pipeline that criminalizes Black youth. For Shawn, metaphor was more than “a mere literary device” (p. 44) but rather a way to challenge how his audience understood school. Across both of these studies, students’ figurative language use was not bound to literary texts but rather used as a critical sociocultural tool to reimagine words and signs within real worlds.

Conclusion

In this reconceptualization of literary reading, we assert the pressing need for youth to imagine together and create worlds in which they are agentic and bold. We argue for an expanded understanding of literary reading and interpretation that encompasses practices of critical imagination as both esthetic and political work. Stetsenko and Ho’s (2015) analysis of play as cultural practice best summarizes the relationship between imagining and producing worlds: “Play is a pathway for children to discover themselves and the world in a bidirectional spiral of mutual becoming” (p. 225). Researchers and educators who recognize the “serious work” (Stetsenko and Ho, 2015) of play as a practice of exploration and critical imagination for refiguring selves and worlds, will be able to support youth worldmaking, positioning and repositioning, and refigurations of language. Within their worldmaking, we can support young people as they not only move between their experiences and the world of the story, but also strive to be seen and understood alongside peers making the same effort. As “worldmakers” youth and adults reflect on and project their belonging in past, present, and future worlds, by reimagining oppressive social discourses through improvisation and storytelling, in performances and published works for audiences who are more than passive listeners or readers, but rather accompanying witnesses to their vision and (re)membering. Working with digital platforms and tools, youth are also mobilizing their passion for story themes and inventions to organize for social change, and by doing so, they directly challenge any assumption that reading is an isolated individualistic escape from reality—or a form of school work, subject to categories of achievement and failure.

Critical imagining supports a view of readers as “social actors” (Holland et al., 2001) who use stories, language, and artifacts to reposition themselves and others and construct alternative identity trajectories for possible ways of being, knowing, and doing in the present and the future. As described in the opening of this chapter, youth are attuned to and critical of narrow subject positions and therefore, agentially restory these representations through practices of inscription that displace and redefine characterizations, settings, and plots in ways that reflect their own passions and identities. Youth also interrogate and rewrite stories, including superhero narratives, to relocate themselves not only in storyworlds but also in their everyday school spaces, where they position themselves as authors and curators. Researchers and educators can also support dialogic inquiry with youth as they examine the ruptures created by authors and artists, through which they call into question taken for granted social positionings. Finally, by reconceptualizing literary reading as a practice of critical imagination we can better recognize language play as an especially literary form of world refiguration. Youth enjoy and produce linguistic meanings and forms by freeing language from singular or limited meanings, as they also assume power to redefine and manage meanings in real and imagined worlds. Researchers and educators can pay attention to and support youth in disrupting limiting discourses about whose language and whose meaning has value in shaping storyworlds and everyday relationships.

Youth who are witnessing the political violence of book banning and white supremacist ideology on the doorsteps of their homes, libraries, and schools, need a harbor made by adults who will safeguard a play space for their imagined present and future selves. When literary reading is understood as a practice of critical imagination, youth are centered as agentic players with worlds and words, whose capacities for restorying, worldmaking, repositioning, and linguistic reshaping, realign them with stories, where they may enter into new worlds, take new positions, reassign meanings and question what is possible.

What else is drama about other than examining “what it is to be human” in the safety of the made event?

Heathcote (2009, n.p.).

There is an urgent need internationally to humanize education as an antidote to the pervasive drift toward dehumanizing standardization. Dramatic approaches have long been used in classrooms to contextualize language and literacy learning and teaching. I propose a rediscovery of the radical pedagogy of Dorothy Heathcote (1925–2011), a renowned British educator, who viewed language and literacies as integral to a holistic approach to education. In this essay, I develop an argument for how the pedagogy Dorothy Heathcote invented could be used to transform education.

I introduced the over-arching term *dramatic inquiry* to characterize Heathcote's deceptively simple yet highly engaging and complex inquiry-based approaches to drama as education (Aitken, 2021; Edmiston, 2010, 2014). I argue that she was a visionary educator whose practice has been over-simplified in its application, under-theorized, and under-appreciated for its humanizing potential. Heathcote was a pioneer in advocating for teachers to educate by dramatizing, dialoguing, and inquiring with young people rather than merely using drama to facilitate student learning determined by an official curriculum or pre-determined standards. I argue that dramatic inquiry pedagogy should be documented, theorized, and researched in ways that recognize its complexity, its humanizing approach to language and literacy teaching and learning, and its transformative potential in any classroom. I illustrate, using a recent example of my own teaching (Edmiston and Towler-Evans, 2022).

Dorothy Heathcote was a humanizing educator. For her, education should always be concerned with the human condition. She stressed that, “All my ideas ... are rooted in the remarkable variations of human encounters” (Heathcote, 2009, n.p.) as teachers explore with young people “what sort of society we want” both within and beyond the walls of a classroom (Heathcote, 1983, p. 693). Heathcote pioneered the use of drama, along with the other arts, to humanize classroom communities and educational pursuits. For over half-a-century she showed how young people and topics can come to life in schools that too often deaden learning and teaching (Bolton and Heathcote, 1999; Heathcote and Bolton, 1995; Johnson and O'Neill, 1984; O'Neill, 2014; Wagner, 1999). As discussed by Lacey and Wooland (2009), her work was grounded in dramatic form and could be considered radical theater practice. Her influence became and remains global. For example, her work has inspired teacher networks in New Zealand (Aitken, 2021) and the UK (<https://www.mantleoftheexpert.com>), summer schools in Jordan (<http://qattanfoundation.org/en/qattan/media/news/ninth-drama-education-summer-school-concluded>), and international conferences (<https://stayhappening.com/e/dorothy-heathcote-now-E3LUS030H4S3>).

Heathcote's dramatic inquiry pedagogy has engaged groups of people of all ages—from children both not yet in school and those in classrooms, to managers in industry, to adolescents in detention facilities and hospital residents classified as mentally handicapped. She focused on events and endeavors that were meaningful to them. She celebrated people's humanity and rejected deficit dehumanizing assumptions and practices within schooling and in society. She approached education holistically,

emphasizing that what teachers wanted young people to learn and how they hoped they might be in the world could not be separated from the students' actual experiences in classroom communities.

Heathcote's intention was always to create rigorous yet joyful communities of critical inquiry into narratives that honor the complexity and dignity of human struggles. These narratives emerge from actual and imagined societies depicted in literature, historical documents, and contemporary accounts encountered via media, in person, and in dramatized events. Though her practice might look very different in varying situations, Heathcote's educational values and ethical principles were constant. She treated every person with dignity as a whole human being of equal value within any group because of their unique life experiences, imagination, energy, and potential to contribute productively to all classroom activities. She worked with young people as colleagues using active and dramatic approaches to entice and include all students in meaningful ventures. Working collaboratively as an artist, she created contexts in which everyone could form more complex understanding of their own and others' humanity (and inhumanity) as they extended their everyday experiences in imagined events, reflected via extended dialogue, and formed pedagogical relationships within an inclusive classroom community. Heathcote was respectful of all teachers and honored the complexity of educators' lives, while being adamantly opposed to mindless, standardized, or oppressive schooling tasks and practices as well as to institutionalized segregation whether on the basis of age, ethnicity, race, native language, test results, or any presumed ability or disability. She wanted teachers to know what they stood for. She spent her professional career, as a professor and guest teacher in classrooms world-wide, advocating for transformative changes in education believing that schools should be reformed, not at the directive of bureaucratic or corporate interests, but rather in response to the personal, social, and cultural human needs of young people and of a democratic society.

Heathcote died in 2011 before the rise of dehumanizing post-truth uses of social media, polarizing attacks on mainstream news, and authoritarianism on both sides of the Atlantic that fueled Brexit and Trumpism. Having lived through depressions, wars, and assaults on democracy, Heathcote would have taken a long view encouraging educators working within institutional constraints to continue building vital communities of truthful humanizing education whether in person or online. She would have reminded teachers that dramatic inquiry can be transformative when premised on equality, while critiquing social and structural inequities and struggling to imagine and be more responsive to the world as others perceive it. She would have advocated for dialogue among competing viewpoints intending to develop ethical frameworks for understanding and promoting the common good within and beyond each classroom.

Dramatic inquiry pedagogy

It is humanity—ours and that of our students too, in all its complexity—and justice that are, and should be, at the core of teaching and teacher education.

Philip et al. (2019, p. 260).

Dramatic inquiry is a holistic humanizing pedagogy that contextualizes and extends language uses and literacy practices in communities within cultural worlds that are actual and imagined. Heathcote rejected education reduced to teachers presenting abstractions or individualized cognitive tasks detached from the embodied, affective, and social lives of actual people within cultures past, present, and future. She proposed and demonstrated a radical humanizing teaching stance across her practice: present any subject contextualized in events in the lives of actual and imagined people in society that can be dramatized, interpreted, celebrated, and critiqued from multiple competing positions via dialogue among young people and adults and across time in collaborative inquiry. Language and literacies are always contextualized in the dialogic interactions, meaningful purposes, and humanizing relationships among young people located within, and shaped by, human events experienced not only in the actual community of the classroom but also created and dramatized from communities within imagined and actual worlds.

Dramatic inquiry pedagogy aligns with established and recent humanizing theoretical conceptualizations of language and literacy education. A sociocultural and historical framework has long been used to conceptualize how dramatic approaches enhance holistic social, cultural, and critical approaches to language and literacy education (Britton, 1972; Davis et al., 2015; Edmiston and Enciso, 2002; Medina and Campano, 2006; Moffett, 1987; Schneider et al., 2006; Wagner, 1996; Wolf et al., 1997). Conceptualizing language use as dialogic meaning-making (Bakhtin, 1981) humanizes education in the sense that across social and cultural verbal and non-verbal interactions people are "learning to learn, think and thrive in the context of working with multiple perspectives and ultimate uncertainty" (Wegerif, 2015). Using dramatic inquiry to engage in reading and composing texts can be understood as inherently imaginative (Enciso, 1996, 2017). Dramatic inquiry embraces the uncertainty of open-ended inquiry in improvised dialogic interactions from competing critical positions on events (Edmiston and Enciso, 2002; Enciso et al., 2016). Rather than reducing language and literacies to representations of what individuals know and understand, human beings can be conceptualized more holistically as "doing-knowing-beings" who are "becoming" language users in society by what we are doing together and how we are being in relation to others as well as by what we are coming to know and understand, collectively as well as personally (Stetsenko, 2017). The recent affective turn, applying affect theory to literacy studies, recognizes what Heathcote always assumed about language and literacy: teachers must become "alive to its affect" as well as "the ethics" of the "visceral experiences" on living bodies (Leander and Ehret, 2019, p. 9). Thus, as knowing-doing-beings we are always sensing, feeling, and acting as well as thinking. A

linguaging perspective has been proposed to stress the social, emotional, embodied, and relational nature of language as social action (Beach and Bloome, 2019; Beach and Beauchemin, 2019). Following Heathcote (1983), as Beach and Beauchemin (2019) put it, “a person cannot be a person alone but rather enacts being human through [building] their connections and relationships with others” (p. 4). Conceptualizing dramatic inquiry as humanizing education embraces the recent posthumanism orientation toward literacy. As Kuby et al. (2019) make clear, posthumanism is not a rejection of a humanistic commitment to, for example, equality, solidarity, community-bonding, social justice, and equity. Posthumanism is “a materialized way of knowing/ becoming/doing the world and (producing) literacies” (p. 6). It assumes that, “humans and non-humans are intra-active agents in the world’s becoming” (p. 8). Dramatic inquiry provides educators with tools to embody, experience, and interpret interactions among human, other-than-human, material, and even structural dimensions of events in actual and imagined societies as young people inquire into who they might become in relation to others.

I propose three significant educational benefits of dramatic inquiry pedagogy that I use to structure the remainder of the essay: humanizing engagement and purpose; humanizing classroom communities; and humanizing relationships and identities. First, I outline two core transformative and humanizing dimensions: dramatic imagination and dramatic dialogic inquiry. Throughout, I weave an illustrative example of my recent teaching in a UK classroom using dramatic inquiry with 10- and 11-year-old children who were already focused on the topic of people who are refugees.

Dramatic imagination

Dramatic inquiry is dramatic in the sense that, like the pretend play of children and adult role-play, young people and teachers collectively use dramatic imagination to embody, enact, and improvise interactions within co-constructed events. Heathcote stresses that as teachers plan, they use dramatic imagination to envision other worlds to be explored by dramatizing events (Heathcote, 2009). I extend the term to include how people collectively enact what they imagine in dramatic inquiry. Dramatic imagination exponentially expands our capacity for dialogue about any subject. In contrast to personal imagination that is invisible to others, with dramatic imagination people of any age embody a collective use of social imagination to interact as if social interactions in imagined events are actually happening. Over time, a coauthored imagined world is created, contained and constrained by fictionalized social situations.

The significance of dramatic imagination as a collaborative use of imagination contextualizing social uses of language and literacy extends the understanding that playing as imagination in action is pivotal in early social and language development (Vygotsky, 1978). Dramatic imagination can engage students in extensive playful, yet serious, collaborative explorations of the actual and possible challenges, responsibilities, responses, and consequences faced by people of all ages interacting in situations across time and space located as if in another cultural world. As Heathcote (2010) stresses, “Dramatic activity is concerned with the crises, the turning points of life, large and small, which cause people to reflect and take note” (p. 74).

Dramatic inquiry can focus on understanding, authoring, and humanizing text. Dramatic imagination extends Bakhtin’s core idea of the dialogic imagination of speakers, writers, and readers (Bakhtin, 1981; Edmiston and Enciso, 2002; Edmiston, 2014; Edmiston and Beach, 2017). With dramatic imagination, dialogic interactions are dramatized. For Bakhtin, writers and readers imagine and compose dialogue among the language genres that people use in different contexts for different purposes. Students working with teachers use contextualizing language to compose events and make sense of text located within meaningful encounters in a fictionalized world. With dramatic imagination, young people and teachers collaboratively compose and revise as they improvise the coauthoring of shared text for agreed or implicit purposes and audiences within events located in a society. When reading is understood as dialogue in imagination with authors and characters to interpret text then with dramatic imagination young people can make public, social, and more extended, dialogue that for readers is usually private inner speech.

July 2019, Newcastle, UK. I am in St John’s Primary School with Iona Towler-Evans, who worked closely with Dorothy Heathcote and is a free-lance dramatic inquiry consultant. We are with Ian Gorman and his class of 10- and 11-year-old children. They are in the midst of a term-long dramatic inquiry-based project he initiated focused on the topic of refugees. With afterschool programming and high parental involvement, the school is a vibrant hub in the local community within a working-class area of the city. A few Asian and Afro-Caribbean Black children are students in each classroom that is predominantly White. Refugees seeking asylum status have been settled throughout the UK though not locally. Ian is committed to social justice education. Having led the children in a project related to local homeless people, he has chosen the topic of refugees that had become a controversial issue around the 2016 Brexit referendum. He has begun to share accumulated information and stories in a critique of the dire situation for people fleeing wars in Africa and the Middle East. Using dramatic inquiry, James has created a fictionalized town with the children so as to explore cross-cultural challenges of resettling people from European camps. On the wall is a map, writing, and drawings all created and used by the children, as if they were a town council. Talking informally with children it becomes clear that they are invested in imagining places, amenities, and businesses in the town and conducting council meetings as they prepare for the arrival of refugees. At lunch Ian asks us to lead in the afternoon. With little time for planning, we gather up some materials aware that we will have to mostly improvise yet knowing we can be guided by the inquiry that has already been established by the teacher.

After introductions, Ian asks the children to tell us about their project. I field comments from eager children. Soon, sensing a loss of focus, Iona begins talking quietly with girls sitting near her. She holds a sheet, making soothing sounds as if she is holding a baby. Girls are keen to rock and pretend to care for the child. I shift everyone’s focus to look as if we are seeing a photograph and then a video of a mother and baby, with possible siblings, waiting for a place to begin their lives again. We listen in to hear the mother’s thoughts: “I am so tired. I just want to find a new home.”

Transforming classroom reality

Dramatic imagination is inherently transformative and humanizing. With social imagination, students and teachers may experience from the relative positions of multiple other people, or non-humans, and interact as if they were those others located elsewhere. Shared experiences of young people and adults are consistent with the social expectations of an imagined world but are no longer perceived as bounded by the physical world nor limited to individual experiences. Dramatic imagination is used not to escape reality, simulate another's reality, or critique from a privileged position, but rather to dialogue from multiple competing positions and thereby transform our classroom reality.

Dramatizing events creates holistic experiences and depictions of events that are interpreted for their significance. Though there are no physical consequences of embodied imagined actions, people may move and interact in community events that are social as well as individual and experienced affectively as well as intellectually. Indeed, it is only when dramatizing stereotypical schooling that students might sit silently at desks working on individual cognitive tasks fixed by a predetermined agenda and monitored by a teacher.

Dramatic inquiry uses dramatic imagination to extend shared classroom experiences by making the power dynamics of teacher-student relationships more equal so as to collectively and collaboratively dramatize events. When all in effect imagine, "What if the world were different?" then dramatic inquiry can be used to embody imagined possibilities of alternative ways of acting in, being in, and understanding the world.

Dramatic conventions

Heathcote invented dozens of drama *conventions* each of which harnesses personal and dramatic imagination to play with time and space. Using these conventions, students interact with teachers to give form to significant experiences and representations of other people and other-than-human aspects of places, which may then be interpreted (Heathcote, 1980b). These conventions can be used to create the experience of forming physical and social space as well as stopping or reversing or fast-forwarding time into alternative pasts, parallel presents, and possible futures. Heathcote used the metaphor of the hologram, a 3-D image of a whole object, to stress how a carefully chosen and depicted encounter can open into a collaborative exploration of facets of a whole topic. She stressed the significance of people interacting in what she called "now time," as if those we "stand in for" were actually present here-and-now and could speak and be spoken to as subjects. For example, a woman and child who are refugees. The affordance of Heathcote's convention of a teacher- or people-in-role means that adults may interact with students as if all are within an imagined event. This was a radical departure from more limited uses of school drama as performance or role-play exercises. Teachers and/or students could now extend dialogue to include people as if in non-realistic times and places, for example, as if in a photograph, a person's memory, or a conceptual drawing. Other innovative conventions include actual or drawn artifacts used as icons to represent the possessions of a person or objects in an event. For example, a sheet to represent a baby's blanket or a letter held by the baby's mother. For Heathcote, conventions are ways to signify and be in dialogue with anything that is "other" than us so as to humanize our experience and interpretation of events that may be concerned with other-than-human creatures, artifacts, environments, and societies as well as particular people.

Dramatic dialogic inquiry

Dramatic inquiry is dialogic inquiry into aspects of the human condition extended by dramatic imagination. The significance of dialogic inquiry in language and literacy education was proposed by Gordon Wells: "To create the conditions that promote sustained student engagement and a willingness to engage in discourse that aimed at increasing understanding." Teachers need to "create communities of inquiry in which all are encouraged to ask 'real' questions and together attempt to construct answers" (Wells, 2001, p. 1). When classroom life is organized for inquiry it is not structured for individual pursuit but rather shaped to become a shared endeavor in which everyone in a classroom community may be in dialogue with everyone else, focused on facing people's concerns and resolving problems inherent in a shared project (Fecho and Clifton, 2017; Wells, 1999). Dramatic inquiry is dialogic inquiry into life events that may be dramatized.

Addressing the children, as if we are the town council, I state, "I understand we've agreed to take in some refugees. Is that right?" There is general nodding. Having asked the children to talk with those near them about what had been agreed at the last council meeting I speak with the boy who says he's taken on the role of the mayor. I learn that he can't quite remember what had happened. Listening in to the others talking it is clear that how they might resettle the newly arriving refugees and who would be responsible remains an open question.

I switch strategies to using a continuum strategy with the class. I ask the children to place themselves in a line to show how strongly they felt about finding a place to live in the town for the woman with the baby. We look at Iona again as if she is in a photograph on her asylum application and wonder how she might be feeling. Children respond out loud including: "Sad" "Help with her baby."

The study of any content in dramatic inquiry is always contextualized by dialogue in relation to events in the lives of people. With dramatic inquiry, young people encounter and work to resolve challenging complex problems that other people are facing while being addressed as contributors to activities focused on inquiring into concerns related to those problems. Focus centers on creating shared meaning, while acknowledging contested meaning, within an ongoing inquiry into human concerns. Teachers can respond to students' questions and interests intending to engage in meaning-making dialogue that may focus subsequent inquiry.

Different approaches to dramatic inquiry

Here I review four approaches to dramatic inquiry and how the concept of framing informs the pedagogy.

Four approaches

Heathcote invented four related ensemble approaches to dramatic inquiry pedagogy: Process Drama, Rolling Role, Mantle of the Expert, and the Commission Model (Heathcote, 2002). *Process Drama* can involve one or several sessions in which a teacher artfully structures activities to focus a group on creating and exploring events in an imagined drama world such as the world of a story (O'Neill, 1995). The *Rolling Role* approach was created to be used primarily by teachers working collaboratively across different classrooms (Davis, 2016). *Mantle of the Expert* and the *Commission Model* are more complex approaches envisioned to continue over weeks or months of extended and deepening dramatic inquiry that may focus on any aspects of curriculum. Below, I elaborate on and provide examples of these two approaches using the frequently used abbreviations mantle and commission.

With a mantle approach, young people and teachers create an imagined community as a fictionalized team with a focus on helping other people with a problem (Aitken, 2021; Heathcote and Bolton, 1995; mantleoftheexpert.com; mantleoftheexpert.co.nz; Taylor, 2016). For example, as if we are a town council planning for the arrival of people who are refugees. Students gradually take on a mantle of expertise shared by an imagined team of people so as to frame their collaborative inquiries over time. In a mantle, young people work as a team to grapple with resolving problems faced by fictionalized people who need help (often referred to as “clients”). In my extended example for this essay, we collectively imagined a fictionalized scenario: a town council is being asked by the UK Refugee Council to help with resettlement. In a commission, students are commissioned by actual people to grapple with real-life problems in an extended project (Heathcote, 2003; mantlenetwork.com/commission-model). For example, in 2016–17 Iona (my co-teacher in the extended example herein) set up a commission with older students in South Wales: a representative from the local library invited young people to create a documentary film on the life of Richard Burton, the actor who had been born and grown up locally (Edmiston and Towler-Evans, 2022). With both these approaches young people may at any time dramatize events: with mantle they interpret as a fictionalized team whereas with a commission they do so as part of their ongoing collaborative work as students.

Framing

Heathcote applied the sociological concept of framing to dramatic inquiry (Heathcote, 1980b). In addition to taking on various social roles of imagined people in dramatized events, she recognized the advantage of adopting a unifying position of assumed responsibility for the welfare of others. A consistent dramatic framing became a core dimension of her mantle approach: collectively imagining that they are a team of professionals or other people facing challenging problems, young people are more open to accepting the need to work collaboratively and take on grown-up responsibilities in activities focused on resolving those problems. Significantly, the people needing help in grappling with those problems personalize the audience for any activities, contextualizing language use and literacy practices in life situations rather than in the context of schooling.

Over time, as young people work as an ensemble through the continued use of mantle or commission approaches to dramatic inquiry, they may acquire established social and literacy practices (Lave and Wenger, 1991). In mantle or commission projects, dramatic imagination is used to explore events from multiple positions in the lives of a myriad of people in past, present, or fictionalized cultural worlds that contextualize ongoing inquiry into a topic. Now the focus of dramatic inquiry extends beyond single texts. When students dramatize and seek to understand events chosen to resemble challenging episodes in the everyday lives of professionals or other people with grown-up responsibilities, within, and at times beyond the classroom, young people encounter, use, and over time may become more proficient at using disciplinary languages and literacies (Moje, 2015) in meaningful and relevant human contexts within communities of practice. Indeed, when guided by a shared humanizing vision of a desired future, what young people imagine may become more of a reality in the changing classroom community.

Humanizing engagement and purpose

Humanizing pedagogy respects and uses the reality, history, and perspectives of [all] students as an integral part of educational practice.

Bartolomé (1994, p. 173).

With dramatic inquiry, teachers can engage every young person, regardless of age or apparent ability, with novel activities employing language and text related to imagined events. Students are consistently positioned with the power to shape events and the authority to interpret.

Heathcote lamented that for students schooling can feel like a perpetual “waiting room” where the institution is denying them “the power to influence” what is happening (Heathcote, 1980a, p. 132). In contrast, with dramatic inquiry the people imagined in fictionalized events have purposes that sustain and deepen student engagement over time when young people identify with the challenges those imagined people face in that cultural world. Everyone playfully but intentionally engages when shifting back-and-forth in imagination between co-creating and co-interpreting; between foregrounding interacting as if all are other people experiencing engaging life events elsewhere and foregrounding interacting as students focused on the meaning of those actions.

Engagement with relational agency

What Anne Haas Dyson has shown about play extends to all young people in dramatic inquiry activities: they are “interwoven with their agency” both “individual and collective” (Genishi and Dyson, 2014, p. 229). Texts can be encountered and created for uses in communities within cultural worlds beyond the school. When young people use language and participate in social literacy practices in events intending to achieve something that they desire and in response to the possible consequences of actions from the perspectives of others they act with relational agency (Edwards, 2005). Dramatic inquiry can establish a norm that the views of other people on any event are worthy of being considered and answered in ongoing engaging dialogue. Young people extend dialogue about particular human concerns as they take up competing points of view on people’s actions while facing the possible consequences for themselves and others.

Most children place themselves at the “I’m sure that the council should find her a home in our town” end of the continuum. Others are in the “I’m not sure” middle. Two boys, Tom and Neill, are alone on the “I don’t think the council should find her a home in our town” end of the continuum. When I ask children to explain their position, the positive reasons range from “She needs our help” to “She has nowhere to live.” Tom says, “They probably have disease.” Neil adds, “They can go somewhere else. They don’t have to come here.” The boys allude to racist anti-immigrant discourses circulating at the time. Seeking to promote some dialogue, I ask for responses. The children basically restate their ideas. While I sense a collaborative sense of community belonging among all students, I feel that continuing to ask questions might reify monologic reactions rather than promote dialogic interactions. It is time for more dramatization.

Heathcote introduced two ideas to conceptualize teaching that promotes engagement with relational agency.

First, teachers work to “awaken the spectator” in every student as all look for the “significance” in the work (Heathcote, 1980a). Greene (1995) believed that young people need the arts so as to be “wide-awake” in school not passively receiving information, but rather, “thinking about their condition in the world, to inquire into the forces that appear to dominate, to interpret the experiences they are having from day to day” (pp. 43–44). Heathcote embraced James Britton’s (1972) vision of humanizing literacy pedagogy. People must learn to use language both as participants and as spectators; we participate to communicate while as spectators we reflect to interpret for meaning. Acting with dramatic imagination, students shift positions to become spectators on their own interactions both as if in an imagined world and as students in the classroom community.

Second, Heathcote advised teachers to actively press students to focus on the “implications” of what people are doing in any event (Heathcote, 1984a). She used drama conventions to shift positions in space while stopping, slowing, reversing, or doubling the experience of time. In doing so she created openings to dialogue focused on looking beneath the surface of imagined people’s acts for likely inferences, causes, consequences, and connections to other possible events all related to whatever concerns or questions guide ongoing inquiry into facets of life. Shifting among different people’s relative positions on events, young people may reflect on the social or cultural significance and implications for others, as well as oneself, and of the consequences of any collectively imagined actions.

Purpose and audience

“Why are we doing this?” When students have explicit and engaging answers to this implicit question then they contribute to classroom activities aware of a purpose that they care about. Dramatic inquiry activities have inherently collaborative purposes: we dramatize events intending to explore together a life-affirming and meaningful topic, such as settling people seeking asylum status. All verbal and non-verbal social interactions and literacy practices have actual and/or imagined people as audiences. As Britton (1972) put it, there are no “dummy runs.”

Purpose feeds extended engagement. Teachers engage students by introducing meaningful content, not only to initially attract attention, but also to cultivate shared interest and promote community commitment to a life-affirming project expected to take time. Young people’s sense of purpose is strengthened when they align with and collectively share the purpose of people framed collectively to address and resolve a pressing concern.

Humanizing classroom communities

What am I doing at this present moment within my society which is of any use? How will what happens in this time contribute to this individual, this group of people, my community, my nation, the world of people and objects?

Heathcote (1984b, p. 171).

A more humanizing classroom community is being created with dramatic inquiry pedagogy as interactions become social practices that establish humanizing classroom cultural norms. Using dramatic inquiry changes “how we do things in our classroom community.” It shifts what’s “normal” about what it means to be a student and how people create new knowledge with language. Everyone contributes to each activity in an unfolding classroom community thereby cocreating a shared world that is both real and imagined.

Education humanizes when the classroom community culture changes so that every young person feels they belong because they are being addressed as already sufficiently competent, capable, or knowledgeable in relation to activities and possible actions that they care about. This is in contrast to feeling that schooling is, in effect, saying to them, “one day you will be good enough to really do [something worthwhile], but not today.” As Heathcote puts it, young people’s relationships with peers and teachers may be transformed when, in relation to an imagined future that they care about, they hear: “Today you are good enough and you really are going to do it” (Heathcote, 1984b, p. 178).

Young people consistently create and experience as an ensemble while also interpreting and critiquing the meaning of any text in dialogue between different perspectives on events from any of the multiple available positions of actual and imagined people. The full range of human emotions from joy to despair or from fear to courage may be experienced and shared in relation to collectively imagined and embodied events. At the same time, abstract ideas, processes, literacies, and more of the complexity of contexts in any subject matter come to life as young people contribute to the inclusive practices of collaborative dramatization of human events.

Ian has identified illustrations from a graphic novel he is planned to show the children before reading the story. When he projects a colored picture of a helicopter lifting someone out of a boat, the children are captivated, perhaps wondering what else might happen. Ian, Iona, and I are able to provide answers to their many questions. Yes, they are refugees. Yes, the helicopter could be British. Yes, the RAF could bring them to the UK. No, not everyone might be saved. I ask the children if they’d like to set up that event. They are eager to “show it like it was.” We move to the carpeted area to imagine boarding and crowding into a small boat each of us with only a backpack filled with precious possessions. We playfully dramatize navigating the waves, being the storm coming, feeling the boat tip, and staring into the water. After practicing again, we agree to make it scarier by imagining it is night. We make the sounds of a helicopter over the sounds of wind and rain. We close our eyes so as to sense the moment. I pause to ask if they want everyone to survive. A few say yes, but most are adamant that some would drown. The tone has become solemn as I ask them to choose whether or not the person that they are imagining will make it. They stand up if they want to imagine being rescued. They stay sitting if they want to not be hoisted into this helicopter. They slide off the carpet if they want to imagine drowning. There is giggling at first but not when we repeat. Tom and Neil both stand to be rescued. I look them in the eye, smiling, yet addressing them with a serious tone: “So you want a community to give you refuge ... You could stay on the boat and take your chances?” They don’t move. Then turning to everyone standing I speak as if I am in the helicopter: “Look down. Don’t forget those we had to leave behind.” If we’d had time, we would have dramatized events in the implicit storylines. Having established what could happen we enact the rescue again but now with Iona and me pretending to be helicopter pilots narrating the event.

For Heathcote, the antidote for dehumanization is not moralizing but humanizing over time with “preventative education.” Heathcote sees racism, sexism, and all systemic inequalities, as like “weeds waiting to become part of a young person’s value system” (Bolton and Heathcote, 1999, p. 129). Heathcote stresses how humanizing values are being formed when the emerging culture of the classroom community is “respectful.” Humanizing values engender an ongoing “context of caring” and “nurture” in which “the language of honoring [all] people can be regularly learned and practiced” so that honoring others becomes normalized as a regular classroom social practice (Bolton and Heathcote, 1999, p. 131).

Humanizing students’ connections with the curriculum

With dramatic inquiry, language and literacy is always encountered and used in context within cultural worlds. Simultaneously, teachers focus on building connections and relationships between young people’s ongoing classroom experiences in the unfolding world of the classroom and the cultural worlds from which different students come as well as with the lives of people in the cultural worlds of whatever content is to be studied. Students are not addressed as generic or idealized. Pedagogy is intended to be culturally and historically relevant, responsive, and sustainable in relation to the actual young people in the room (Ladson-Billings, 1995; Paris, 2012; Muhammed, 2020).

Dramatic imagination may be conceptualized as creating a permeable membrane between the lives of people in a particular classroom community located in a school within the world of education and people’s lives in communities located in cultural worlds beyond the classroom that must be imagined to be experienced. The curriculum as content studied in school, for Heathcote, should always be a living encounter between the actual people in a classroom and the lives of other people either met in person or who must be imagined yet are accessible via dramatic imagination. This is echoed in Dyson (1993) who argued nearly thirty years ago that curriculum should be “permeable” not based on “standards.” Dyson’s research shows why: “the worlds of teachers and children come together in instructionally powerful ways” that includes “the interplay between teachers’ and children’s language and experiences.” Dyson, like Heathcote, is emphatic: creating a “shared world is essential for the growth of both oral and written language” including sense-making and awareness of audience. Forming a shared world not only in reading together but also in playing together creates a humanizing community: “it is essential as well if teachers and children are to feel connected to, not alienated from, each other” (p. 1).

The understanding of young people becomes more complex when their actual experiences extend in imagination to connect with other people’s ways of making sense of different cultural worlds. Dramatic inquiry activities must “protect students into experience” and not leave them emotionally exposed (Heathcote, 1978, p. 153). Because dramatized experiences are both real and imagined, students choose to engage in actions anticipating any physical and emotional affects. For example, agreeing to pretend to be in a sinking boat when they know they are not going to drown even though they may imagine the feeling of panic when floundering in the water as they move their bodies. Thus, in the way that biological membranes (like skin) protect and regulate what moves in and out of an organism, teachers can use dramatic imagination with groups to create shared experiences that focus collaborative inquiry in relation to facets of events that are experienced holistically yet selectively.

Dramatic inquiry creates a what is ~ what if? permeable space-time for new ways of being in the world to emerge. Not only are the possibilities of “what if?” informed by people’s existing knowledge and past experiences of “what is” but over time the inverse can also be true; humanizing experiences of imagined events can transform the assumptions, values, and possibilities of everyday classroom life.

Transforming classroom communities

Maxine [Greene \(1995\)](#) argues that community, “has to be achieved by persons offered the space in which to discover what they recognize together and appreciate in common ... infused by imaginative awareness that enables those involved to imagine alternative possibilities of their own becoming and of their group’s becoming ... reaching toward some common world” (p. 39). If society is to become a more morally just and caring democratic society, Greene argues that people must be consciously wide-awake so as to engage in critical inquiry. She rejects the notion of passive socialization. For her, the arts and humanities can “awaken the imagination” and allow us to actively and socially explore the human condition to “bring human beings in touch with themselves” (1977, p. 124).

Anna [Stetsenko \(2017\)](#), the Vygotsky scholar and sociocultural theorist, similarly rejects passive and individualistic assumptions about education. She calls for teachers to “transform” the status quo by envisioning with students and bringing into being a desired classroom community. Rather than be content with students only “adapting” to established ways of being while “assimilating” knowledge and skills, Stetsenko calls for teachers to adopt with students a “transformative activist stance.” When power is shared in dramatic inquiry, following Stetsenko, teachers actively work with students as a community, addressing them as potential “contributors” to all activities not just participants. Established power dynamics can shift so as to collectively imagine and bring into being a more humanizing classroom community. Young people’s agency can be transformative as well as relational: as teachers and students contribute to activities then they are both shaping the cultural world and being changed by interactions ([Stetsenko, 2019](#)).

However, as [Lensmire \(2011\)](#) argues, a commitment to transformative change can be overly serious. Lensmire calls for a joy that dramatic inquiry can bring. He puts it this way: “in order to criticize and remake the world [we] need to play (with ideas, with each other) in order to experience something better—a something better than throws the present shortcomings into bold relief. Seriousness can undermine truthfulness. Criticism may require laughter” (pp. 125–126). Playfulness is inherent in dramatic inquiry pedagogy. With dramatic inquiry we create events that are both joyful and serious and in which possible ways of being in the world are not only referenced but may be embodied and experienced in encounters located in a time and space previously only talked about: “Time and space are rearranged in ways which show their contingency and indissolubility. All of this is done in a mood of celebration and laughter” ([Robinson, 2011](#), n.p.).

With dramatic inquiry, teachers and young people can bring into being radically different and less hierarchical ways of being in community. Ways that open up more possibilities for how to interact and create understanding in dialogue that may critique existing assumptions by playing around with possibilities. In dramatic imagination we can create playful, ever-changing, “carnavalesque” spaces. For [Bakhtin \(1984\)](#), these are “characterized by freedom, equality and abundance [where] rank is abolished and everyone is equal” ([Robinson, 2011](#), n.p.). Unlike traditional performance spaces, the carnivalesque spaces of dramatic inquiry are “communal, with no boundary between performers and audience.” The social consequences for interactions are profound: “It creates a situation in which diverse voices are heard and interact, breaking down conventions and enabling genuine dialogue.” The traditional teacher–student status divide is destabilized, it “eliminates barriers among people created by hierarchies, replacing it with a vision of mutual cooperation and equality.” Teachers may represent children while students may depict professional adults ([Robinson, 2011](#), n.p.). As [Heathcote](#) argued, everyone’s “stature” as a person is now more important than one’s social “status” in everyday life ([Heathcote, 1971](#), p. 69). Anyone may engage the world and dialogue taking up the relative positions of people implicated by events in an imagined world. The permeable space of dramatic inquiry becomes “a zone in which new birth or emergence becomes possible.”

Some children want to imagine a different outcome for their character. I direct another playful dramatization that has both laughter and moments of stillness. Some children pretend to be hoisted into the helicopter, others are not, with some becoming those who rescue or greet with blankets, food, and water. Iona again takes up a pose as the woman with the baby as I narrate how she has been one of those rescued by the helicopter and eventually flown to a camp in England where they are now.

A classroom community formed with dramatic inquiry is a playful group intentionally focused on collaboratively and artfully exploring how the world could be different. Everyone is a potential shape-shifter able to explore aspects of other cultural worlds from multiple relative positions by imagining events from the standpoints of different people within collectively imagined encounters. Unlike the riotous herd behavior at the US Capitol on January 6, 2021, in a carnivalesque community there is dialogic space for young people and teachers to inquire into both humanizing and dehumanizing facets of socially imagined experiences in the lives of other people as all improvise dialogue. With dramatic inquiry, as people explore and experience aspects of other people’s lives, we are transforming our personal and shared experience and our understanding of how people might be in the world.

Humanizing relationships and identities

Humanizing approaches involve the building of relationships of care and dignity ... involving reciprocity and respect ... feeling valued by a worthy witness.

[Paris and Winn \(2014, p. xvi\)](#).

Dramatic inquiry pedagogy can humanize language and literacy education for students in classrooms by enriching the relationships among young people and teachers and the social practices related to texts that establish cultural norms in a classroom community. Young people can relate to topics of concern, what is “other” than them, by creating and dramatizing representations of other people and non-human dimensions of anything that becomes the subject of their shared inquiry. Young people are (as much as possible) actively contributing to all activities and engaging in social practices that humanize their relationships with one another, with adults in the room, and with people in other cultural worlds. As Heathcote puts it, young people in a classroom community ideally are forming both a collective sense of “we” as well as a growing trusting connection with each teacher and peer, all of whom they identify as “colleagues.” As such, in dramatic inquiry, most actions are “we-for-us” (Edmiston, 2014). Over time, young people may humanize their relational identities as students in a classroom community and as people in the world.

Dramatic inquiry is premised on equality and thus the potential for dialogue with all people within and beyond the physical classroom. Like the philosopher, Jacques Rancière (1991), Heathcote always began with a “presupposition of equality.” Rather than working toward equality, Heathcote began with a presumption that everyone’s way of being, along with their ideas and interpretations, are already equally worthy of being recognized, taken seriously, and responded to. How, as teachers, we relate to some people must not be more privileged than how we relate to others.

I ask the children to come back to where we’d been in the room 20 min earlier and to place themselves again on the continuum. Everyone has moved closer toward the “I’m sure that we should find her a home in our town” end, including Tom and Neil who have moved slightly.

Transformative crucible

Heathcote introduced the metaphor of a crucible to characterize the personal and social transformative potential of dramatic inquiry (Heathcote, 1983). Like a crucible that may be used to heat, and with stirring transform, existing materials into new substances, dramatic inquiry extends predictable classroom interactions by introducing alternative ways of being and knowing. Dramatic inquiry interactions may feel challenging to young people, even though they can be fictionalized and transformed into unexpected experiences, novel ways of relating, and unanticipated realizations. However, having experienced being in the crucible changes people. As the anthropologist, Dorothy Holland puts it in relation to play worlds, “we may return to the everyday with an altered subjectivity, an altered sense of who we are.” Over time, dramatizing events in other worlds can “help us envision new identities.” Over time, we are playfully coauthoring a “refigured” community in which “new worlds and new identities are created” (Holland et al., 1998, p. 238, 239, 250).

When young people dramatize novel encounters that contextualize competing ways of making sense of events this is felt as dramatic tension. Dramatic tension not only engages people to experience events but is also like the heat in a crucible that allows competing positions on events to be experienced as intermingling and in dialogue with each other rather than remaining distinct. In the crucible people can have heated interactions without being angry. Dramatic inquiry fosters collective exploration not personal disagreement. Though heat may be generated via dramatic tension, in social interactions as if in imagined events students’ experiences have built-in emotional distance since any uncomfortable disagreements, like any comforting agreements, are about topics in an imagined world and not focused directly on everyday life. Heathcote stresses the significance of the indirect approach of dramatic inquiry:

It may be impossible for young children to recognize their own value system dictating “this is how life is,” but they *can* learn to look for a deep level of explanation of behavior in the characters within a fiction.

Heathcote (1984a, p. 142).

Heathcote used framing to increase (or decrease) emotional distance from events yet focus on responsibility and accountability for the consequences of actions (Eriksson, 2011). Students and teacher can focus collectively on how people might respond to questions or concerns as part of an ongoing inquiry. A teacher’s interactions and use of dramatic conventions is like stirring different viewpoints together so as to promote and press for transformative dialogue with novel perspectives, between students’ views, and within each young person.

I stand by the boys. I ask Tom what he’s thinking: “She might have caught a disease in the boat.” Despite some groans from other children, I support his position: “It’s true. People can catch diseases and I don’t want to catch one. Do you?” I make a face of disgust as I address the question to his peers. There are several shakes of the head. “We could take her to the hospital to be tested” suggests one of the girls, “My dad works there.” She moves toward Iona and others join her. “What do you think, Tom?” After several embodied exchanges showing how this might happen, I press him: “So, if we were able to test her and found she didn’t have any diseases, what do you think we should do?” He nods: “We should find her a home.”

Transformative Dialogue

Dialogue is more than talk. It is thinking together in response to authentic questions and concerns (Mercer, 2004; Nystrand, 1997). Dialogue can involve experiencing at the same time different ways of being in and making sense of the world (Bakhtin, 1981). With dramatic imagination, young people and teachers collectively embody events in the narrative world of any text as if those events are

actually happening in a physical, social, and cultural world. Further, they both experience and interpret life events from the multiple and competing perspectives of any of the people depicted in the narrative worlds of any printed, narrated, embodied, composed, or digital texts.

Dialogue is transformative when experienced as a back-and-forth receiving-and-giving of recognition and ideas. Dialogue in the potentially transformative crucible of dramatic inquiry can be understood as occurring in a mutually created “Third” space created “between” two (or more) competing perspectives on events (Benjamin, 2018). In this Third space, the psychologist Jessica Benjamin (2018) conceptualizes that “the self is changed by having to struggle with the other’s difference” (p. 3). A changing self is in contrast to a static, unchanging, or narcissistic self that is either unaffected or more entrenched by an encounter with another. For each person, the self can be “projecting into the not-me” that may include “its own vulnerability” (p. 14) creating space for an “internal confrontation” (p. 19). Ideally there is “mutual responsiveness and transformation” (p. 3). Transformation can be both personal and in relation to others. As Benjamin puts it, in the Third “our attachment to all beings as part of the whole is honored as real One’s humanity depends not only on the respect one receives but the quality of the recognition one gives, that indeed one’s own dignity is fostered by giving recognition” which is “reciprocal recognition” (p. 234).

With dramatic inquiry, young people, and teachers, can imagine and then dialogue from the previously unconsidered position of any person, including positions judged as oppressive or otherwise dehumanizing. In dialogue, young people may begin to question some existing assumptions though they may not. The experience of intermingling dialogue contextualized by interactions between actual and/or imagined people with different relational positions, may create feelings of discomfort that especially over time can lead to transformative, humanizing change in students’ ways of being, doing, and knowing (Edmiston and Beach, 2017).

I turn to Neil, who looks a bit distracted: “How do you feel about that idea?” It is almost the end of the day and the children will have to leave soon. I am unsure if Neil has been listening. I look at my watch saying we’ll have to end soon. “So, what about this home for her. Where could it be?” I muse. “We could build it” says one of the girls. Though there is no time to consider the complexity of this idea I am enthusiastic: “We could! I wonder where?” “We could build it here!” the girl replies. The idea might seem fanciful. However, these children had actually witnessed a derelict field adjacent to the school be transformed into a sports field for the school and the community along with a building for indoor activities. Children had been included in school-wide dialogue related to the initial planning ideas. I move as if lifting a heavy load: “I could carry bricks. Can anyone help?” A couple of the children join me. “Does anyone have any tools?” I make the sound of a drill. Though some gravitate toward packing up, most children join in pretending to build. I turn to Neil, “Do you have any tools we might borrow?” “I have a hammer.” I am appreciative: “Could you help us hammer in these nails?” As the children start to line up to leave, Neil and I are laughing as we pass an imagined hammer back-and-forth and pretend to strike nails. Ian quietens the children to thank us. I nod: “Unfortunately, we can’t come tomorrow. I wish we could see the home the people in the town built. I wonder what name was written over the door?” There is a sense of completion when one of the girls who’d sat close to Iona suggests, “How about ‘The Helping Home?’” No one disagrees.

Humanizing identities

Our social and cultural identities are how we identify with groups and communities of other people and thus act in relation to them to humanize (or dehumanize) relationships. Students’ identities, like teachers’ identities, are dynamic, not fixed (Holland et al., 1998). They shape and are shaped by the shared values and cultural norms of a community. Everyone’s subjective experience of being in the classroom community is affected by, and affects, how people come to assume they should act relative to other people in the world within and beyond the school. Additionally, dramatic, dialogic interactions over time can shape how students identify ethically (Edmiston, 2000, 2008). The significant social and personal transformation of relationships that is possible via the humanizing experiences, activities, social practices, and outcomes of dramatic inquiry can transform identities (Medina and Campano, 2006). Thus, young people may begin to change what it means to them to identify with others as “students” in the classroom as well as how they identify as “people” in the world beyond the school all of which shapes how they may act in society.

When young people and educators are focused on intentionally realizing in the present, aspects of a collectively imagined common good tied to a vision of a hopeful future, then they are acting to transform relationships both within the classroom community and with people in communities beyond the school. Over time, dramatic inquiry pedagogy can make a difference to the changing relational identities of young people as humanizing students, readers, writers, language users, and people.

Over time, dialogic interactions among students and teachers can create possibilities for each young person to become a more grown-up human being in the world in terms of taking on new responsibility and acting in relation to others with more awareness of other viewpoints and of the consequences of actions (Biesta, 2014). Rather than reify facets of established abstract ideas, young people may clarify and extend their understanding of life including realizing more about their own value system as they contextualize existing knowledge and assumptions in back-and-forth humanizing responses to different perspectives on challenging concrete problems faced by people in imagined events.

Conclusion

Freedom dreaming is imagining worlds that are just, representing people’s full humanity, centering people left on the edges, thriving in solidarity with folk [folks] from different identities who have struggled together for justice.

Love (2020, p. 103).

Marcus Crum (2020), in his concluding column in the special issue of the *Journal of Literacy Research*, “Black Lives Matter in Literacy Research,” argues that teaching, along with research, should be evaluated to determine whether they are “supporting human well-being or undermining human well-being in our racialized societies” (p. 544). Further, he stresses that such evaluation is only possible when, “we rethink and redefine what it means to be human and what it means to be ourselves.” However, doing so requires that we recognize that, “Who we imagine others as depends a great deal on who we imagine ourselves to be” (p. 544).

In dramatic inquiry we draw on everyone’s knowledge, experience, and skills developed in the past and we are aware of the present status quo. Yet, with dramatic inquiry the future for students is not predetermined adaptation. With dramatic imagination we can embody and experience a more humanizing future as if we were already there. Within long-term projects young people are able to develop literacy knowledge and critical practices as they use language to enact grown-up ethical responsibilities both toward other people being served and to one another within classroom communities. With shared experiences of alternative ways of being in the world we can be in dialogue about how to get there more often. It is no longer a case of teaching with a “one day you’ll be good enough” stance in relation to content that is always “over there.” Using dramatic inquiry we begin with attention to our here-and-now relationships with young people addressed as already good enough yet all on a shared imaginative journey to becoming more humanizing people in the world (Heathcote, 1978, p. 178).

I advocate for dramatic inquiry pedagogy because, like Love (2020), I am “imagining life not death, imagining seeing the world, and imagining freedom ... to preserve humanity” (p. 102). Dramatic inquiry creates a sense of an ongoing dance between what is and what if. The status quo—what is generally accepted as the way schooling is—can be in a continual dialogue with alternative ways of being educated in a classroom community—what if our classroom was a more humanizing community? Dramatic approaches need not be tangential to education but via dramatic inquiry pedagogy may become established ways of envisioning and bringing into daily classroom life how we all want to be in the world so that the world might become a better place.

Introduction

Learning about art, whether that be appreciation, creation, or critique, is worth time in schools. Eisner (1965), a champion of arts-based education, wrote, "I would like to propose that the art education curriculum be built along three major lines of focus. These three foci are *the productive aspects of art, the critical aspects, and the historical aspects*" (p. 11). As such, students should have access to art specialists who can lead lessons designed to develop student's artistic abilities. But that's not the point of this chapter; instead, we focus on the role that the arts can play in literacy and language learning.

What are the arts?

Wikipedia defines art as follows: Art is a diverse range of human activities in creating visual, auditory or performing artifacts, expressing the author's imaginative, conceptual ideas, or technical skill, intended to be appreciated for their beauty or emotional power (<https://en.wikipedia.org/wiki/Art>). In school systems, we typically think of art along the following lines:

- Visual art, which include the traditional fine arts such as drawing, painting, ceramics, photography, sculpture, works in wood, and mixed media.
- Drama or theater, which include performance and interpretation of performances.
- Music, which includes singing and the use of instruments.
- Dance, which involve a range of movement experiences and the interpretation of movement.
- Media arts, which includes photography, imaging, sound, animation, video, web design, graphic design, virtual design, and interactive design.

As we have noted before, these are each worthy of instructional attention in their own right. For example, students in Singapore experienced a series of lessons (including dance, music, drama and visual arts) focused around the concept of space (Bautista et al., 2016). As the authors noted, "the arts are often regarded as areas for enrichment or even entertainment within schools" but they demonstrated the learning of students within the arts themselves (p. 624). Students in a school in Turkey used the arts to explore their personal histories (Coşkun, 2017). As one of the students noted, "I used to read Derrida, since high school, and I was seriously obsessed with his theory about deconstruction. What Derrida said was that in order to understand the whole we needed to deconstruct it. When you analyze something into its pieces you actually understand it better, from pieces to whole" (p. 360). Our point is sharing these two studies of arts education, from the thousands that are published worldwide, is to convey the idea that art is a discipline in and of itself. We do not want to imply that art is only useful in service to other areas. Having said that, there is fairly extensive literature base about the ways in which the arts impact literacy and language learning.

Consider the very young child who sees an image, possibly a drawing or sculpture. The young child wants to talk about it, ask questions about it, and understand it. All the while, this child is using and developing language. Jessie's mom took him to a museum just after his third birthday. Each Tuesday, different museums in our community are free. On this particular day, Jessie and his mom visited the Timken Museum of Art (www.timkenmuseum.org). As they visited, Jessie noticed Jean-Honoré Fragonard's painting *Blindman's Buff* (*Le Colin-Maillard*), c. 1775–80. As he looked at it, he started saying colors: *green, white, blue*. He then pointed to the dress a woman was wearing and said *red*. His mom responded, "Honey, we call that pink. It's like red but softer and has more white in it. Do you see it?" He started pointing to other parts of the painting saying *pink, pink, pink*. He pointed to another

part of the painting and said *baby*. He then asks, “what are they doing?” pointing to the man with a blindfold. His mom responds, “I think that they are playing a game. He doesn’t look scared and the day is very nice, so I think it’s something fun that they are going to do.” Their conversation continues, but we’ll pause here to consider the literacy aspects of this interaction.

To be sure, Jessie was learning to appreciate and analyze art, but he was also developing vocabulary, applying knowledge about words to images, asking questions, engaging in a conversation, and building background knowledge that he could use later.

Oral language development

One of the things that stands out in Jessie’s interaction with his mom at the museum is his development of oral language. And oral language is a critical aspect of literacy development. As many have noted, human brains are hardwired to speak and listen but not read and write. Instead, every brain must learn to read and write (e.g., Wolf, 2008). The importance of oral language in learning to read and write cannot be overstated. Consider the following two quotes:

- “Oral comprehension sets the ceiling on reading comprehension” (Biemiller, 2003, n.p.).
- “Reading and writing float on a sea of talk” (Britton, 1983, p. 11).

Both convey the power of oral language and the impact that strong oracy has on literacy development. Yet, oral language has been, and continues to be, a neglected aspect of literacy instruction and has been for some time (Holbrook, 1983; Rossiter et al., 2010).

There are any number of studies that provide tools for educators to foster students’ oral language skills. We will highlight several that involve the arts as these are easy and fun ways to engage students in speaking and listening. For example, Brouillette (2012) highlights the use of creative drama to develop oral vocabulary skills for students in kindergarten through second grade who were learning English as an additional language in US schools. As one of the teachers noted, “When we acted it out, more of the kids were engaged, even the kids who couldn’t say the words yet. At the beginning of the year, they copy movements. Eventually, they understand how to say that, using language” (p. 144). Similarly, Stinson (2015) noted the value of drama in improving students’ oral language development with elementary-aged students in Australia. In this study, parents noted increased self-confidence in their children as well as increased engagement in school because the children “have something to say” (p. 303).

Music can also be used to foster students’ speaking and listening skills (Mobbs and Cuyul, 2018). In fact, these educators offer recommendations for song selection to develop students’ oral language skills, including the clarity of the lyrics, vocabulary choices, grammar structures, and cultural sensitivity.

In addition to helping to develop students’ oral language skills, music promotes multiculturalism among students in the classroom (Paquette and Rieg, 2008). As DiDomenico (2017) notes, music can be integrated into the classroom such that listening skills are developed. Cornett (2007) discusses several research-based findings that generally show that music-based instruction helps to increase students’ self-concept, language, cognitive development, listening skills, critical thinking, and social skills. She claims: “Every musical experience that we offer our students affects their brains, bodies and feelings. In short, it changes their minds permanently” (p. 463).

In addition, students can talk about fine arts to build their speaking and listening skills. In our documentation of regular museum visits, students’ oral language skills improved as their teachers invited conversations and discussions about the various exhibits that the students attended (Pumpian et al., 2006). In this investigation, over 1000 students from a historically low-performing school spent one week each month of the school year in a museum, learning content through the arts available in that museum. Their literacy skills improved significantly as they interacted with each other, the arts, and their teachers. In fact, the school was recognized for the increase in the reading performance of students and was identified as a distinguished school in California.

As we will see in the remainder of this entry, the arts can develop students’ language and literacy skills. Let’s start with early aspects of reading, which are phonological awareness and phonics.

Phonological awareness and phonics through the arts

Children learn to read through acquisition and consolidation of the sounds, symbols, and meaning of language. The sounds and their corresponding written symbols require coordination of key areas of the left hemisphere of the brain responsible for discriminating speech sounds, phonological awareness, and decoding words (Dehaene et al., 2005). Because the brain is not hardwired to read, instruction during the primary grades focuses on the coordination of these systems.

The sounds and written symbols of a language are constrained skills, which are “small sets of knowledge that are mastered in relatively brief periods of development” (Paris, 2005, p. 184). The smallest unit of sound (phonemes) vary by language. English has 44 phonemes, while Spanish has 25. The written symbols also vary. The English alphabet’s 26 letters and letter patterns (graphemes) represent the phonemes. The ability to accurately map the sounds of a language onto the graphs of the language is phonics knowledge, completed in typically developing children by the age of 8 or 9.

Phonological awareness

Phonological awareness is the ability to decipher and manipulate speech sounds, syllables, and rhymes. Adams' (1990) proposed five levels of phonological awareness:

Level 1: Hearing rhymes and alliteration

Level 2: Oddity tasks, such as figuring out which word in a string does not rhyme

Level 3: Blending words and splitting syllables

Level 4: Orally segmenting words

Level 5: Manipulation tasks that require the ability to delete, substitute, add, and reverse phonemes.

Music is a natural fit for teaching phonological awareness (PA) and is widely utilized for this purpose. Music enhances the acquisition of early language skills, especially through singing, chants, clapping, and the use of rhythmic instruments (Fisher, 2001; Gromko, 2005). A study of music education on the phonological awareness of kindergarteners found that children with higher exposure outperformed same-age peers on measures of manipulation and rhyming. In addition, their rhythm ability correlated to their PA skills (Moritz et al., 2013). Similarly, Gromko (2005) found that 4 months of literacy-based music education resulted in statistically significant gains among kindergarten students.

Singing and movement appear to have positive effects on the phonological awareness of young children. Auditory discrimination of pitch is associated with elements of PA, particularly the ability to segment and manipulate phonemes (Lamb and Gregory, 1993). There is emerging evidence of the link between the cerebellum, which controls movement, and the pre-frontal cortex, which governs cognition, in the development of academic skills (Piek et al., 2008). Callcott et al. (2014) evaluated the effectiveness of a movement and music literacy program of action-based songs that incorporated fine and gross motor practice, cross-lateral coordination, and rhythm on Australian pre-primary students. The children who participated in the movement and music literacy program outperformed peers on measures of phonological awareness and developmental spelling. Rule et al. (2006) found that students in grades 1 through 3 who participated in a movement and language program improved their PA at higher levels than those who attended a traditional pull-out literacy intervention program. The combination of singing songs, body percussion or instruments to keep the beat, and dance movements require an organization of aural, temporal, and spatial reasoning similar to those needed in reading (Gromko and Poorman, 1998).

Music and movement are commonly incorporated into classroom phonological awareness activities (Adams et al., 1997). Songs and chants that are brief and repeated so that they become familiar routines form the core of these experiences. The developmental need of young children to play as a means to learn dovetails well with the word games, rhymes, and movement featured in many PA programs. Multisensory games that allow children to hear slight shifts in language, often to humorous effect, are utilized to coordinate with finger play. Nursery rhymes such as "Hickory Dickory Dock" and "Old McDonald Had a Farm" are readily adapted to include gestures, clapping, and movement. Other examples include incorporating children's names in chants, foot stomping to count out syllables, and simple chants, and songs that use repetitive lyrics that change slightly (e.g., "There Was an Old Woman Who Swallowed a Fly").

Phonics

In practice, phonological awareness instruction is coupled with phonics instruction to build decoding and word recognition skills. Thus, lessons are often a combination of instruction about letters and words that accompany the songs, chants, and movement. A study of Canadian 4- and 5-year-olds found a correlational relation between musical skills, phonological processes, and early reading ability (Anvari et al., 2002).

The alphabetic principle is integral to early decoding, as children need to accurately and rapidly recognize letters and their associated sounds (Chall, 1999). Many language arts curricula include multisensory songs designed to teach students the alphabetic principle. Although not extensively researched, DiLorenzo et al. (2011) did show that a multisensory alphabet program was effective for typically progressing students, special education students, and others deemed to be at risk academically.

An innovative dance-based reading program was utilized with more than 700 first-grade students to improve their alphabetic and phonics skills (McMahon et al., 2003). The researchers used an experimental methodological design to assess the impact of the 20 lessons on students' code knowledge (consonant and vowel recognition). Over a 3-month period, students used their bodies to make the shapes of letters and letter combinations of sounds. Members in the experimental group who had originally scored lower than control group students outperformed them at the end of 3 months, a result that the researchers noted "the program took low-performing readers and turned them into significantly better readers" (p. 119).

The use of music for the purpose of developing early reading skills in word knowledge has been documented as effective as intervention for struggling readers (Register et al., 2007). Song lyrics have been used to improve decoding and word recognition skills with middle school students with learning disabilities (Hines, 2010). The researcher noted that popular songs can be motivational for adolescents, and that the salience of music makes recollection of lyrics easier (Morrongiello and Roes, 1990). Students in the study selected popular songs with the teacher and rehearsed them over a period of days using printed lyrics. Difficult words were highlighted and practiced until the student could read all of the lyrics accurately. Words that the student had difficulty with were then used to create rimes and word ladders to build the student's decoding skills and promote transfer of learning to new words. For example, *fake* was expanded to include the rimes *make*, *bake*, and *shake*. Word ladders, which require a one-letter change with each word, helped students read through the entire word. Thus, *sell* became *spell*, *spill*, *spin*, and *spit*. Students who participated in the program made gains in their decoding skills.

The arts can be an effective vehicle for teaching early reading skills with young children. Many early literacy scholars argue that these approaches should be combined with systematic phonological awareness and phonics curriculum designed to ensure that acquisition of these constrained skills is not left to chance (Juel and Minden-Cupp, 2000; Snow et al., 1998). These early decoding skills are essential for reading, but do not represent all facets needed. Fluency and comprehension are also necessary for meaning making.

Reading fluency and comprehension

Reading fluency is generally comprised of two factors: rate and prosody. Rate is the speed at which a person reads. Too slow, and meaning is lost. Too fast, and meaning is lost. It appears that there is a just right, or Goldilocks, rate for reading. It is generally understood that readers who “sound good” when reading aloud are also good comprehenders (e.g., Kuhn and Stahl, 2003; Hudson et al., 2009). In their study of 98 kindergarteners and 170 first graders in Korea, Kim et al. (2014) noted that there “developmental relationships among listening comprehension, word reading fluency, text reading fluency, and reading comprehension” (p. 94) and that these relationships changed as students reading levels increased. Interestingly, in this Korean study, “listening comprehension largely explained variation in reading comprehension” (p. 94) for early readers but becomes less explanatory as text reading fluency begins to play a role in understanding.

But rate is not the only factor that impacts fluency. Prosody, or the expressiveness with which a person reads, also contributes to understanding of the text. Prosody involves the appropriate intonation, rhythm, and emphasis given to words and sentences when they are being read. Typically, prosody instruction focuses on reading aloud, but the goal is that students internalize this type of reading and develop an inner speech while reading. It seems that readers, when reading silently, use prosody in ways that are similar to what they would do while reading aloud, thus the Implicit Prosody Hypothesis (Fodor, 2002). Importantly, the ways that readers use these prosodic representations affect their interpretation of the text (Breen, 2014). As Breen et al. (2016) have noted, there is a relationship between prosody and comprehension through high school. In their study of 112 elementary school students in Spain, Calet et al. (2017) noted that prosody training was the most effective method to improve both fluency skills (speed, accuracy, and prosody) and reading comprehension.

It should be clear that fluency is an important aspect of literacy. But where do the arts enter the picture? In their review of research on students with disabilities, Stevens et al. (2017) noted the relationship between reading fluency and comprehension, emphasizing that repeated reading remains the most effective way to improve reading fluency. In their study of bilingual students in Vietnam, Gorsuch and Taguchi (2008) noted the value of using repeated readings to increase reading rates, which in turn impacted reading comprehension. The question is how to get students to read again and again to improve their fluency, both in terms of rate and prosody.

That’s where the arts enter. Students are likely reluctant to read texts again unless they see a clear purpose for it. Preparing for a performance, whether that be a dramatic interpretation, signing, or readers’ theater, seems to invite students to read texts over and over, thus improving their fluency. As Young et al. (2016) noted, performances allow students to practice with a purpose. In their study of second graders, integrating performances into instruction resulted in statistically significant gains in fluency. Similarly, Iwasaki et al. (2013) described a musical method in which students learned a song and performed it each week. Each day, students interacted with the song lyrics and practiced. The result of the integrate of music was a significant increase in reading scores. With older students, Biggs et al. (2008) examined the use of an interactive singing software with middle schoolers in the United States. Their findings suggest that fluency improved as a result of reading and re-reading texts in preparation for singing. Further, Paquette and Rieg (2008) described the value of using music to develop literacy skills in young children, especially their fluency as they sign and develop a sense of pace.

Similarly, readers theater has been used encourage repeated reading and improve fluency (Keehn, 2003). Readers’ theater is a dramatic reading without costumes, props, scenery, or special lighting. Students use their vocal expressions to help the audience understand the story. Typically, students read and re-read the script in preparation for the performance. In some cases, students create the script from a longer text. As Martinez et al. (1998) noted, using drama and theater in this way improved students’ fluency both in terms of rate and prosody. Evidence from the use of readers’ theater with high school students in Turkey suggests that students enjoyed the experience and that increased their participation, self-confidence, self-control, and curiosity of the subject while also encouraging repeated reading and improved reading fluency.

In the case of fluency, it appears that many of the effective approaches in literacy are based on experiences with the arts. As students read to perform or engage in repeated readings and singing of songs, their rate and prosody improve as does their overall reading comprehension. And, as evidenced in several of the studies reviewed, students enjoyed the experience having the arts integrated into their instruction.

Vocabulary learning

Word knowledge is a significant predictor of comprehension (Yildirim et al., 2011). Students need to learn a lot of words every year in school if they are to understand the texts that they are expected to read. Thankfully, we all learn many words incidentally, as we read and listen to others (Swanborn and de Glopper, 1999). Other words need to be taught (Biemiller, 2011), particularly in the

context of reading and writing. One of the challenges with vocabulary learning is that it is unconstrained (Paris, 2005). Unlike phonological awareness and phonics, and to a certain extent fluency, which have a more finite level of learning, vocabulary continues to develop across our lifetimes. That growth occurs in both depth and breadth. As we get older, our vocabularies expand as we deepen our understanding of words, often learning more obscure meanings, historical derivations, and newer usages.

There are a number of evidence-based approaches to teaching vocabulary (Hiebert, 2019). In this entry we will focus on the role that the arts can play in developing students' word knowledge (LaBrocca and Morrow, 2016). In their study in Iran, Gorjian et al. (2012) developed authentic art experiences that included visual arts, literature, drama, music, and dance and studied the impact that these experiences had on learners' vocabulary. They noted significant increases in word knowledge and attribute those changes to the experiences students had with art. As they noted, "Working with something that is concrete such as art to something abstract such as language encourages students to link their own experiences" (p. 349).

Charalambous and Yerosimou (2015) describe the use of drama, music, and media to improve students' vocabulary knowledge in a Greek school located in London. As they noted, "In situating the focus on creative and artistic process through which to develop the language at focus, we observed that students' interest in language learning was enhanced and their motivation to come to school and learn Greek was developed" (p. 380). Their study demonstrates the ways in which the arts can be used to introduce and reinforce vocabulary knowledge in a multilingual setting.

In the United States, Keehn et al. (2008) studied the use of readers theater with middle school students. The students engaged with short stories using scripts developed by the researchers. They compared students who participated in weekly readers theater with those who did not and noted that the vocabulary of those who did doubled compared with those who did not.

Also in the US, Fisher and McDonald (2001) describe the integration of music to build students' phonics and vocabulary skills. As they note, music invites student to meet words, and unique uses of words, that they might not otherwise encounter and, in doing so, students vocabulary increases.

Finally, Montgomerie and Ferguson (1999) describe the ways in which drama can be used to build students' knowledge. They were specifically interested in developing students' critical literacy skills. Their students were between the ages of four and eight and lived in the United Kingdom. As the authors noted, the use of process drama provided a rich context for language development including the construction of argument and adoption of different ways of speaking depending on circumstances. In doing so, students vocabularies were extended.

Writing

The language arts are categorized as receptive and expressive domains. Listening and reading are receptive in nature, in the sense that they require the ability to comprehend received messages. Speaking and writing are expressive language skills, as a message must be produced in forms that can be understood by others. Writing is the apex of language production and as such requires consolidation and coordination of multiple systems to encode, including composition, grammar, spelling, and idea generation (MacArthur et al., 2016).

Writing is itself an expression of art, especially in the field of drama. The texts of plays and films begins its life in written form as an original or adapted script. In this context, art is story and can serve to both provoke writing as well as to be an outcome of the process.

Participatory photography is a research method approach used with learners as a way to illuminate their lives and experiences (Singhal et al., 2007). Our own work with struggling ninth grade writers led to us to using participatory photography through a photo essay project accompanied by original writing (Frey, 2003). Using their cameras, they shot scenes from their lives outside of school. Once printed, each student curated their collection of photographs to compose a story using visual and written text. Wise-man et al. (2017) reported on a similar approach with third grade students in a Literacy Through Photography project. The students engaged in three projects: self-portraits, African proverbs, and community photographs. A cross-case analysis of interviews with the students surfaced themes of the application of visual strategies for communication, social collaboration with peers, and connections to community experiences.

As the availability of visual tools has expanded, digital storytelling (DST) has received increased attention. Noguerón-Liu and Hogan (2017) used multimedia visual tools in a cross-generational project of immigrant youth and adults from the Michoacán state in Mexico to examine transnational similarities and differences existed among them. Using a similar participatory methodology, they drew themes about composition processes in light of the migratory histories of families, and the its application to literacy learning in adolescents' US classrooms to strengthen writing. The use of DST appears to boost writing skills of students. Because digital storytelling involves many aspects of writing at the preproduction level, including planning, determining the flow of the story, and listing the visuals to be used, conventional composition improves. As an example, Sarica and Usluel's (2016) study of 59 s grade students in Turkey revealed that writing skills improved after DST, as did their visual memory skills.

The use of visuals in graphic novels can be used to prompt and scaffold writing with young students as well as adolescents. Paneling in sequential storytelling is essential for the flow of ideas. Pantatelo's (2013) study of the use of paneling in the composition of original graphic novels composed by Canadian fourth grade students revealed that their decisions about color, size, and shape of the panels in the texts they created were deliberate and translated to other written forms. In some cases, original graphic novels are created by students as a means to improve writing skills and foster motivation in writing. That was the case in a study of the use of graphic novels by Caribbean high school students using both their home language and English (Manning-Lewis, 2019).

Our studies of the use of graphic novels with high school students have revealed similar findings. One study was done with students in World History and English classes (Frey and Fisher, 2010). In English, they were introduced to observational skills using visuals to hone their eye for detail. Several times a week, they wrote short responses to a visual image displayed by the teacher. The World History teacher soon adopted a similar method, using photographs and paintings of historical events. Not only did the amount of writing increase over time, but content analyses conducted by the teachers revealed that the quality of their writing improved.

The use of visual arts as both a means for expression and as a tool to prompt writing continue to develop as access to tools becomes more widespread. Student and teacher access to videos, photographs, and museums has made it possible for writing classrooms to bring a wider range of masterpieces in art to students. In an increasingly visual world that relies on images to tell real and imagined narratives, their use in schools will likely only expand.

Conclusion

As we have noted, art is important in and of itself. As Cummings noted, “Viewing or creating art can be a form of mindfulness, experiencing life in the moment while noticing your feelings without judging” (2020, p. E2). As such, students should experience art for arts’ sake. We are not arts specialists but rather educators who understand that the arts contribute to human thought in a number of ways. In this entry, we focused on the ways in which the arts can contribute to literacy and language development. Of course, teaching literacy is not limited to the arts. There are a vast number of instructional approaches useful in developing students’ prowess in reading, writing, speaking, listening, and viewing. It’s just that the arts can add a bit of flair to literacy learning. It may just be that the cliché is true: A picture is worth a thousand words. So, let’s tap into every possible tool we have to build students’ literacy lives.

The [Oxford English Dictionary \(2005\)](#), the reference source for the English language, has entries for 616,500 word forms. This number does not capture all possible word meanings for a single entry, as illustrated by the six meanings for the entry *message* and the seven for *acquire*. Evidence is also unequivocal that the breadth and depth of individuals' vocabulary influence their textual comprehension (e.g., [Wagner and Ridgewell, 2009](#)). The lexicon is large, the size of students' vocabulary is consequential for learning, and time in classrooms is short. As educators, we are confronted with the question: Which of the many words in English should be taught?

An immediate answer to this question is that direct instruction is only one mechanism for acquiring vocabulary. Students learn the meanings of thousands of words as they interact in their communities. The word consciousness approach posits that if students are immersed in classrooms where vocabulary is rich, then they develop a love of words that results in a deep and engaged vocabulary ([Scott et al., 2008](#)). Meanings of words are also acquired through reading because many words appear more frequently in texts than in conversations ([Nagy et al., 1987](#)). Strategies such as the use of the textual context to establish unknown word meanings are another means of acquiring vocabulary ([Nagy et al., 2014](#)).

Even when all these forms of vocabulary instruction—word consciousness, strategies, and extensive reading—occur in English/Language Arts (ELAs) classrooms, there remain words that require direct instruction, such as those with complex meanings (e.g., *annihilation*) and with multiple meanings (e.g., *current*). [Nagy and Hiebert \(2011\)](#) proposed a framework for considering which words to teach in ELA instruction. Since that review was completed, numerous vocabulary interventions have been conducted. Further, advances in digital technology have meant access to large corpora of school texts and databases that allow key word features in these corpora to be established ([Brysbaert et al., 2014](#); [Kuperman et al., 2012](#)). This review updates research on word selection for direct instruction. Specifically, four topics are addressed: (a) the size of the lexicon of school texts, (b) features of words that influence the acquisition of word meaning, (c) findings of interventions that provide insight into vocabulary acquisition, and (d) questions that remain unanswered.

The research findings and conclusions of this chapter, while focused on word selection in classrooms where English is the primary language, have applicability to vocabulary instruction in other languages. The English lexicon may be somewhat larger than those of other languages, because of its historical roots in both Anglo-Saxon and Latin. However, most languages follow a pattern that has been described as Zipf's law ([1935](#)), which postulates that the frequency of any word in a corpus of natural language utterances is inversely proportional to its rank in a frequency table. That is, a relatively small group of words accounts for the majority of the words used in the conversations and writing of most languages, while a sizable portion of the lexicon accounts for only a small portion of the total words. Among the 100 languages that [Mehri and Jamaati \(2017\)](#) examined, all did not comply stringently to the frequencies proposed by Zipf but all followed this pattern of a small group of words making up the majority of words and a large group appearing infrequently. [Milton \(2009\)](#) concluded that, while Zipf's law may not be a perfect description of language, it is useful for describing the number of words required to reach specific thresholds in mastering a lexicon. Determining which words merit use of instructional time from among the many words in the lexicon of any language needs to be strategic, if students are to have the capacity to comprehend and learn from the complex and varied texts of the 21st century.

What is the size of the lexicon that students will encounter in school texts?

All 616,600 of the unique word forms in the OED are not expected to occur in school texts by any means. Numerous words represent the technical terms of highly specialized disciplines, whereas a sizable group consists of archaic words. However, if even a relatively small portion of the entire corpus appears in school texts, then students are likely to encounter many words.

In 1921, Thorndike identified 10,000 words as the appropriate focus for school instruction and, subsequently, 30,000 words (Thorndike and Lorge, 1944). Since Thorndike's analyses, which depended on manual vocabulary computation, computers have aided researchers. Numbers of unique words that students are predicted to encounter in school texts vary as a function of the size and contents of the corpora and include figures such as 154,941 (Zeno et al., 1995) and 86,471 (Carroll et al., 1971). The number of words that are predicted to appear at least once or more per million, however, is fairly consistent across databases: 19,928 (Zeno et al., 1995), 17,281 (Carroll et al., 1971), and 19,440 (Thorndike and Lorge, 1944).

Even addressing 20,000 words in the school curriculum is a massive undertaking. Nagy and Anderson (1984) suggested that when root words share transparent meanings with inflected and derived word forms, each instance of a word family may not need to be treated as a distinctive entity for vocabulary instruction. On the basis of a representative sample of Carroll et al.'s (1971) database, Nagy and Anderson predicted that school texts from grades 3 through 9 contained approximately 88,500 distinct word families.

Hiebert et al. (2018) used Nagy and Anderson's (1984) morphological lens to establish the number of word families that account for the majority of words in school texts. Hiebert et al. found that a group of approximately 6000 words that appear 10 times or more per million words of text (Zeno et al., 1995) could be reduced to 2500 word families with a shared root word. These word families accounted for 91.7% of the total words in texts described as exemplars of appropriate texts from grades 1 through 12 (National Governors Association & Council for Chief State School Officers, 2010).

In a related analysis, Hiebert (2017) identified an additional 3000 word families among words with frequencies from one to nine appearances per million words in the Zeno et al. (1995) database. This second level of word families accounted for an additional 4.5%, on average, of the total words in the exemplar texts. That is, approximately 5500 word families accounted for 96.7% of the total words in exemplar school texts from grades 1 through 12.

The findings on the core vocabulary (Hiebert, 2017; Hiebert et al., 2018) were replicated in an analysis of the words in four ELA programs from grades 1 through 5 (Graves et al., 2019). In this analysis, 4000 simple word families (i.e., words grouped by shared inflected endings within the 6000 most-frequent words) accounted for 90% of the words in texts. This analysis provided insight into the remaining 10%. This relatively small percentage of total words consisted of more than 20,000 unique words. Furthermore, 34% of the words in this group appeared a single time in the 2 million words in the database.

In summary, a core group of words accounts for the majority of words in the texts. In addition, students will encounter thousands of rare words in school texts. These rare words are often those that convey unique knowledge in informational texts or give narrative texts their texture and quality. A perspective on word selection must address both rare words and frequent words.

How does research on word features clarify which words to teach?

The typical approach to vocabulary instruction has been to select six to eight words from a text for a week of instruction (Stahl, 1999). For example, in a current ELA third-grade program (Beers et al., 2020), six words from *The Storyteller's Candle* (Gonzalez, 2012) were identified for a week of instruction: *chimed*, *concluded*, *flickered*, *gallant*, *preparations*, and *slender*. It is essential that students are able to understand the words in a text to comprehend its content (Brett et al., 1996), but the basis for choosing these words for instruction is unclear. Will words such as *chimed* and *flickered* be more challenging for most third graders than *rehearsed* and *applause*, which are also in the text and relate more directly to the story's theme of a celebration organized in an immigrant community?

Recent research on the influence of word features on vocabulary learning can aid in identifying the words that will most benefit from instruction. Two topics are discussed in this section: (a) features that influence knowledge of word meaning and (b) groups of words that might benefit from instruction.

Features of words that influence students' word knowledge

The frequency with which words appear in texts has long been recognized as an influence on vocabulary knowledge (Ryder and Slater, 1988). Students' prior experiences with words or familiarity has also been recognized as having an influence on vocabulary (Balota et al., 2001). These two criteria have been prominent in widely used instructional frameworks (Beck et al., 2013; Biemiller, 2010) and in vocabulary interventions (Scott et al., 2006).

Frequency and familiarity, although critical, are not the only features on which words vary. Nagy and Hiebert (2011) identified additional features of words as affecting vocabulary acquisition, including morphological relatedness, semantic relatedness, concept difficulty, and appearances across content areas (dispersion). Other word features have been shown as influential in the understanding of word meanings, such as degree of abstractness, concreteness (Schwanenflugel et al., 1992), and polysemy (the number of meanings associated with a word; Miller and Lee, 1993).

Multiple variables, rather than single ones, are likely to influence students' ability to learn and retain word meanings. In one such analysis of multiple word features, Cervetti et al. (2015) examined the relationship of seven word features—length, part of speech, polysemy, frequency, morphological frequency, domain specificity or dispersion, and concreteness—to second to fourth graders' knowledge of science vocabulary before and after an integrated science and literacy program. Three features were predictive of word knowledge (pretest score) at two or more grade levels: frequency, polysemy, and length. Frequency and polysemy explained students' vocabulary growth scores (posttest controlling for pretest) at two of three grade levels.

The availability of recent databases for word features such as age of acquisition (age at which words typically appear in children's oral environments; Kuperman et al., 2012) and concreteness-abstractness (Brysbaert et al., 2014) has meant an increase in the comprehensiveness of analyses of word factors on vocabulary knowledge. Hiebert et al. (2019) used these two databases, as well as frequency of word and of word family members, number of letters and of syllables, domain specificity, polysemy, and part of speech, to identify predictors of students' vocabulary performances in two large-scale projects that used distinctive assessments. In the first study, 28,901 students from grades 2 to 12 took grade-appropriate forms of a multiple-choice assessment of words predicted to occur with moderate to high frequency. Word frequency and age of acquisition predicted students' performances.

In the second study (Hiebert et al., 2019), 6976 fourth and fifth graders, 52% of whom were English learners, responded to six multiple-choice questions that each represented an aspect of word knowledge (metacognition, semantics, morphology, syntax, definitions, and polysemy). As in the first study, age of acquisition predicted student performance, but number of letters and syllables and word location (which word frequency confounded as words on the assessment became progressively less frequent) were also significant. In addition, English learners' vocabulary knowledge was significantly influenced by the concreteness of words, as evidenced by superior performances on concrete words.

Recent research has extended insight into the variables that influence the rate and retention of vocabulary learning. However, the lack of availability of databases for critical variables hampers acquiring a comprehensive perspective on word features. For example, conceptual difficulty has been shown to be a strong influence on students' learning of word meanings in context (Nagy et al., 1987; Shefelbine, 1990), but to date, no large-scale database for establishing conceptual complexity exists.

Groups of words that might benefit from instruction

The features of words require attention but so does the role of words in texts and curriculum (Nagy and Hiebert, 2011). In ELA, individual texts have been the most frequent basis for word selection, which is viewed as necessary for the comprehension of those texts. At the same time, questions can be raised as to whether words from texts can be selected to support generalizations about vocabulary use. To date, no curriculum has been designed specifically around the text of ELA instruction.

Attention to a vocabulary curriculum in ELA is essential, especially with the increase of informational texts in ELA programs. The words of informational texts appear to be treated in much the same way as those of narrative texts (Norris et al., 2008). The need for and potential avenues of exploration for identifying a vocabulary curriculum for the distinctive words in ELA programs' typical informational and narrative texts will be explored in the final section of this review.

One group of words that has begun to be treated as a distinctive vocabulary curriculum in ELA are general academic words (Nagy and Townsend, 2012). General academic words are not specific to a discipline; rather, they are words such as *category*, *consists*, and *specific* that are used to describe and clarify content-specific words in texts. Many of these words are distinguished by their abstractness and multisyllabic structure (e.g., Gardner and Davies, 2014).

Numerous research projects addressing general academic words have occurred over the past 15 years. The Word Generation (WG) program represents the most extensive and sustained research project of general academic language (Lawrence et al., 2012). A recent report from this project was based on the performances of 7752 fourth through seventh graders over a 2-year program (Jones et al., 2019). After 1 year of the treatment, significant overall impacts were found for academic language or reading comprehension for grades 4–5 or for grades 6–7. In year 2, the WG elementary curriculum had a statistically significant impact on all outcome variables of interest for the elementary cohort. The effect sizes for distal measures of academic language and comprehension ($ES = 0.06$ and $ES = 0.15$, respectively) were significant for the elementary group in the second year, whereas only the effect for distal reading comprehension ($ES = 0.16$) was significant for the middle-school students.

Various explanations have been given for the relatively modest effects of large-scale projects of general academic vocabulary, including the need for longer interventions. Facility with the abstract, polysyllabic nature of most general academic words likely requires exposure over an extended period. Further, these words are typically part of content texts that can be dense with complex subject-specific words. The role of general academic words as part of understanding subject-specific words requires attention, as does the level of exposure in texts.

What has research shown about the types of words

That benefit from vocabulary interventions?

Meta-analyses of vocabulary interventions have consistently reported that direct instruction promotes students' learning of instructed words and their comprehension of texts with those words (e.g., Marulis and Neuman, 2010; Stahl and Fairbanks, 1986; Wright and Cervetti, 2017). The finding that students learn what they are not taught is unsurprising (Fisher et al., 1981),

but when an average of 18 min of instructional time is devoted to each word in an intervention (Cervetti et al., 2019), a compelling question relates to the generalization of this learning to students' overall vocabulary and comprehension.

Consistent transfer of results from interventions to knowledge of words or comprehension beyond the taught vocabulary appears to occur at preschool and kindergarten levels, where vocabulary is assessed through receptive and productive oral language (Marulis and Neuman, 2010). For grades 1 and beyond, where assessments typically require students to read independently, results have not been as consistent or positive as those for preschool and kindergarten interventions. In an early meta-analysis of vocabulary instruction, Stahl and Fairbanks (1986) reported an effect size of 0.30 on a global measure of comprehension. In a subsequent meta-analysis with more conservative calculations of effect size and criteria for study inclusion than in Stahl and Fairbanks's (1986) analysis, Elleman et al. (2009) found no effects of interventions on transfer or distal comprehension outcomes.

Similarly, Wright and Cervetti (2017) found only 2 of 36 vocabulary interventions to have significant effects on distal measures of comprehension. Both of these studies were distinctive in that they taught words in semantic clusters (Beck et al., 1982; Nelson and Stage, 2007). Elleman et al. (2009) reported a significant effect for distal measures of vocabulary, but their basis for this conclusion was not a comprehensive sample of vocabulary interventions with distal vocabulary outcomes. In a subsequent comprehensive investigation of studies with vocabulary outcomes, Cervetti et al. (2019) reported a lack of significant differences of vocabulary interventions on distal vocabulary outcomes.

When effects of vocabulary instruction are insignificant on generalized vocabulary and comprehension assessments, researchers often cite the limitations of standardized assessments and the size of the English lexicon. These factors cannot be dismissed, but at the same time, little attention has been paid to the features of words in interventions and the relationship of word features to student performance. That is, might results be tied to the words that are taught?

To address this question, Hiebert and Nagy (2021) examined words taught in 15 of the 19 interventions in Cervetti et al.'s (2019) meta-analyses of vocabulary interventions. Each of the 1640 words was examined on 11 features: word length, frequency, frequency of morphological family, age of acquisition, concreteness-abstractness, polysemy, part of speech, dispersion, first grade of appearance in text, conceptual complexity, and semantic category. The studies were clustered into four grade bands: K, 1–2, 3, and 4–5.

Words at all grade bands were similar on all measures except for frequency, age of acquisition, and first grade of appearance. Words at K were more frequent than those at other grade bands, but even at this point, more than half the words were predicted to occur less than once per million words of text. Age of acquisition and first grade of appearance increased across the grade bands, but differences between students' actual age and age of acquisition and grade of first appearance were large at the K and grade 1–2 bands.

The research to date indicates students can learn words through instruction, even when words are unlikely to be in students' oral language or in the texts they read. However, when words are not used frequently in current language contexts, the carryover to students' overall vocabularies and comprehension appears limited. A question to be addressed in the next section of this review is whether instruction of words that may foster the comprehension of specific texts can be extended to words with similar functions in future texts that students will encounter. That is, can infrequent words such as *flickered*, a target word for a text in a core reading program (Beers et al., 2020), be used to illustrate the role of action and motion, even of inanimate objects, in narrative texts?

What research might support efficacious vocabulary instruction?

There will never be a perfect list of words to teach in English. The English lexicon is complex, but several conclusions are possible from this literature review as to the types of words that are likely to support increased textual comprehension. First, a small but growing body of evidence can be used to make fairly accurate predictions regarding which words will be relatively straightforward for students to understand. Further, tools are available so that these findings can be tested and elaborated with additional databases of students' vocabulary performances.

The availability of data on what features likely influence vocabulary knowledge can be used to distinguish among the many rare words that students are likely to encounter in text. Hayes et al. (1996) predicted approximately 3 rare words for every 100 words of text. That means the number of words in a text with 1444 words such as *The Storyteller's Candle*, which students likely have not encountered before, far exceeds six target words. Furthermore, current data can be used to predict which of these words merits direct instruction. Of the six target words from *The Storyteller's Candle* chosen for instruction (Beers et al., 2020), three are highly concrete and easily described with a word that is similarly concrete but has an age of acquisition at the kindergarten level and is easily decodable: *thin-slender*, *ring-chimed*, and *twinkle-flickered*. The three remaining target words are somewhat abstract, but one, *gallant*, has an easily decodable synonym, *brave*. The features of the other two abstract words—*concluded* and *preparations*—are polysyllabic, members of rich word families, somewhat complex to define, likely to appear in content areas, and central to the text's theme, which make them good candidates for instruction. A similar analysis can be applied to the other 35 words in the text, which are predicted to be relatively rare in text.

Findings from the existing research provide some guidance for curriculum developers in selecting words that merit direct instruction. At the same time, questions about which words require direct instruction and the nature of this direct instruction far outnumber answers at this point. In this final section, two issues are addressed that are central to supporting strong vocabularies for all students: (a) the need for an ELA vocabulary curriculum LA and (b) the need for databases for features such as conceptual complexity and polysemy and for assessments that give insight into students' knowledge of specific portions of the lexicon.

The need for vocabulary curricula

Students apply their knowledge of words in the context of specific texts, making the presence of vocabulary in texts a necessary and important consideration in the direct instruction of vocabulary in ELA. However, a topic that has not been considered within ELA is whether the words that are selected from specific texts can represent underlying constructs characteristic of genres. That is, can words for direct instruction be chosen on the basis of curriculum to ensure transfer to words in other texts? General academic vocabulary is one group of words that has begun to be treated as a curriculum. Other potential candidates for vocabulary curriculum can be identified. One such candidate pertains to the words that account for the majority of words in text or the core vocabulary. A second consists of the less frequent words that are unique to literary texts and the informational texts that are common in ELA.

Core vocabulary

As discussed earlier, a relatively small portion of the lexicon accounts for a majority of the words in texts. Within ESL, this core vocabulary is viewed as an essential foundation of proficient reading in English (Coady, 1997). Researchers in the field of ESL have the size of the lexicon required to read particular kinds of texts. According to Nation (2006), novel reading requires 9000 word families, and newspapers require 8000 word families. In the instruction of young children who are learning to read in English, however, attention to the core vocabulary has been limited to the high-function words that make up approximately 1% of the core vocabulary (Hiebert et al., 2018).

Students who cannot automatically recognize the core vocabulary appear to be challenged in learning words while reading, even less complex words (Cain et al., 2004; Shefelbine, 1990). Several interventions directed at increasing students' automaticity with the core vocabulary have demonstrated transfer to generalized comprehension measures. This finding has been reported with English learners (August et al., 2020), struggling readers (Fehr et al., 2011), and ESL students (Tozcu and Coady, 2004). The finding of transfer to generalized comprehension measures from core vocabulary interventions varies from research of direct vocabulary instruction (Elleman et al., 2009; Wright and Cervetti, 2017) where, as Hiebert and Nagy (2021) found, target words are typically infrequent in students' oral and written language.

Much needs to be understood, however, about core vocabulary interventions. Students may be familiar with many common words but may be challenged by their multiple meanings or their ability to make connections to morphological relatives. Furthermore, valid assessments are essential to ensure interventions do not cover words with which students are familiar. The present state of core vocabulary assessments is addressed in the final section of this review.

Vocabulary unique to literary and informational texts

As a result of guidelines from the National Assessment of Educational Progress (2009) and the Common Core State Standards (National Governors Association Center for Best Practices & Council of Chief State School Officers, 2010), the number of informational texts has increased substantially in many ELA classrooms. The design of ELA vocabulary curriculum, then, must address the words in informational as well as narrative texts.

Informational and narrative texts convey different types of content, which leads to the expectation that their vocabularies would vary. However, the selection of words for different genres requires more than assumptions. Several unique vocabulary features in narrative and informational texts have been documented. First, Gardner (2004) showed that, when common words (i.e., 2000 most frequent words) were eliminated, the unique words in narrative and informational texts on the same themes rarely overlapped.

Second, the less frequent vocabularies of the two genres come from distinctly different semantic clusters. In a comparison of target vocabulary in ELA and science programs, Hiebert and Cervetti (2012) reported that target words in ELA texts fell into clusters such as character roles, traits and ways of communicating. The majority of target words in science texts came from categories such as the natural environment and machines and materials.

Third, the cohesiveness of target words for individual selections followed unique patterns in the two genres. The target words for a science passage were cohesive, as illustrated by the words chosen for selections on sound and light that uniformly pertained to physical attributes of things, events, and experiences. By contrast, few of the words in a typical ELA passage fell into the same semantic cluster. Returning to the words selected for instruction with *The Storyteller's Candle*, none of the six target words (*chimed*, *concluded*, *flickered*, *gallant*, *preparations*, *slender*) came from the same semantic cluster.

Although the target words in ELA texts' individual passages represented an array of semantic clusters, words from similar clusters (e.g., communication, emotions, and attitudes) were targeted for most selections. Target words for selections that followed *The Storyteller's Candle*, for example, came from similar clusters (e.g., *graceful* (*slender*), *brilliant* (*gallant*)). This similarity of semantic clusters across narrative selections raises the possibility that instruction might focus on the function of particular words in literary texts rather than only on the meanings of individual words. That is, *slender* and *gallant* (and, subsequently, *graceful* and *brilliant*) could be used to demonstrate the crucial role of character traits in a story's plot and resolution.

An unresolved issue in the discussion of semantic clusters is the degree to which the words in these clusters interfere with one another in meaning. In the ESL field, vocabulary learning can be hampered when the meanings of words are too close. Using forms of nonsense words to simulate the learning of words in a nonnative language, Tinkham (1997) compared the learning of college sophomores regarding semantic clusters (e.g., *apple*, *pear*, *nectarine*, *peach*, *apricot*, *plum*), thematic clusters (e.g., *cave*, *explore*, *dark*, *stalactite*, *drip*, *cool*), and groups of unrelated words (e.g., *paint*, *funeral*, *recipe*, *market*, *uncle*, *ice*). Results led Tinkham to conclude semantic clustering hinders learning, whereas thematic clustering facilitates vocabulary learning.

In working with young learners who are learning to read in English rather than adult learners in ESL, the associative learning emphasized in ESL may not characterize the learning of semantic categories in that at least some of the words, such as the words in Tinkham's (1997) fruits category, are likely in young learners' vocabularies. Evidence for this suggestion that the learning of semantic clusters may function differently with young learners who are learning to read in English comes from Beck et al. (1982), which is one of the few vocabulary interventions to show an effect for distal comprehension measures (Wright and Cervetti, 2017).

In Beck et al.'s (1982) study, members of semantic groups were connected but not exact synonyms. For example, *glutton* was taught in relation to words related to eating (e.g., *nourishment*, *famished*). In a follow-up study, Stahl et al. (1992) taught the word *glutton* with words more closely associated in meaning (e.g., *obese*). The Stahl et al. study did not produce significant results, leading the authors to discourage the use of semantic clustering. It could be argued that Beck et al.'s categories are more thematic than semantic, whereas Stahl et al.'s were more semantically connected. Semantic and thematic word clustering as a mechanism for expanding students' vocabulary requires further investigation.

The target words for a selection in an informational text are of the type that Tinkham (1997) described as thematic such as *tomb*, *pharaoh*, and *pyramid* in a text on new ways of studying mummies. Several studies that have used a thematic approach in word selection have shown positive outcomes (Lubliner and Smetana, 2005; Simmons et al., 2010).

Word selection in informational texts in core reading programs does not appear to take advantage of these thematic connections. The pattern that Norris et al. (2008) reported well over a decade ago is apparent in a core reading program of the 2020s (Beers et al., 2020), as illustrated by the words chosen for a biographical text on an urban farmer (Briggs, 2016): *scarce*, *pollution*, *factories*, *vats*, *crowded*, *greenhouses*, and *vertical*. Some of the target words pertain to the theme, but additional theme-related words appear in the text (e.g., *composting*, *hoophouses*) and likely merit instruction attention more than words such as *crowded* and *scarce*.

The descriptive informational articles and biographies in ELA programs typically do not have the technical vocabulary of content-area textbooks. In a unit on recycling in a core reading program (Beers et al., 2020), words that might be expected in science lessons such as *biodegradable*, *polyurethane*, and *deforestation* do not appear, but words such as *plastic*, *recycled*, and *energy* do. ELA is not the sole context for the development of complex, content-area vocabulary, which is built through discussions, lessons, and activities of content areas. However, the manner in which the unique words of informational texts in ELA can be used to develop background knowledge on various topics that create the contexts of narrative texts and are germane to content areas requires consideration.

The development of databases and assessments

To increase our knowledge about and support for the best possible vocabulary instruction, work is needed in regard to expanding databases and creating assessments that clarify the portions of the lexicon with which students are and are not knowledgeable.

Databases

New databases have supported understandings of how word features influence vocabulary acquisition and retention, specifically age of acquisition and concreteness. But there are other word features that have been shown to challenge students, most notably conceptually complex words (Nagy et al., 1987) and polysemous words (Cervetti et al., 2015). In both the Nagy et al. and Cervetti et al. studies, the researchers developed coding systems that they used to manually code a limited number of words. Fitzgerald et al. (2017) proposed a system for conceptual categories, but this effort has not moved beyond experimental use to date. The existing large-scale database of polysemy—WordNet (Miller, 1998)—lacks precision.

Nagy et al. (1987) found a simple two-point measure could be used to predict conceptually complex words. It may be possible to tag large groups of words for conceptual complexity through a crowdsourcing technique similar to that used in recent databases of age of acquisition and concreteness-abstractness (Brysbaert et al., 2014; Kuperman et al., 2012). The development of tools that tag word features such as conceptual complexity and polysemy must be a priority of future vocabulary research.

Assessments

Vocabulary assessments, Pearson et al. (2007) observed, have been structured to compare students' vocabulary across groups, not to describe students' knowledge of specific bodies of words. Over the past decade, federal funds have been allocated to producing and validating new vocabulary measures. Several vocabulary instruments went through rigorous validation procedures as part of the Reading for Understanding (RFU) initiative. These assessments covered the range from K–2 (Foorman et al., 2015a) to grades 3–12 (Foorman et al., 2015b; Sabatini et al., 2015). Additionally, several individual vocabulary assessment projects were developed over the past decade (Goodwin et al., 2020; McKeown et al., 2017).

The measures designed over the past decade have several features that distinguish them from previous vocabulary measures. First, emphasis in these assessments is on morphology. Indeed, the grades 3 to 12 vocabulary subtest of the Florida Center for Reading Research's Reading Assessment (FRA) exclusively assesses morphologically related words (Foorman et al., 2015b). The Morphology subtest of the Educational Testing Service's (ETS) Reading Inventory and Scholastic Evaluation (RISE) assessment focuses on prefixes and/or suffixes attached to a root (Sabatini et al., 2015). Second, general academic vocabulary is emphasized. The *Core Academic Language Skills Assessment* is devoted entirely to academic language (e.g., general academic vocabulary; Barr et al., 2019), whereas one of the RISE subtests (Sabatini et al., 2015) assesses general academic vocabulary and content-area vocabulary, although separate scores do not appear to be given for the two vocabulary groups.

However, these new emphases in vocabulary assessments have not been accompanied by information on portions of the lexicon with which students are adept or challenged. Similar to previous vocabulary assessments, the new generation of assessments continues to provide information on students' performances relative to those of their peers. Scores of "proficient" on the FRA and RISE vocabulary subtests fail to indicate whether students will be able to establish the meanings of unknown words in typical grade-level ELA texts.

The ability to discern the meanings of words within the context of texts assumes proficiency with the bulk of words that make up the text—the core vocabulary. Assessment of students' proficiency with different bands of the core vocabulary has not been a focus of researchers and educators concerned with the literacy learning of young students learning to read in English. By contrast, this topic has been central in assessments within the ESL field (Schmitt et al., 2020). The *Vocabulary Levels Test* (VLT; Nation, 1990; Schmitt et al., 2001) typifies this commitment. The VLT establishes students' vocabulary knowledge at four frequency levels: 2,000, 3,000, 5,000, and 10,000 word families. Three items represent every 100 words within a 1000-word band. If a student gets half the words correct at the 2000-word level, then the number is multiplied by 10 (to represent all ten 100-word bands) to give students a score of 150. This score, however, does not indicate whether a student's correct responses came in the initial bands of the 1000 word families or were distributed intermittently across the bands.

Words are chosen randomly to represent a word-frequency band on the VLT, which means highly familiar words (e.g., *hat*, *boy*) are as likely to appear, as are less familiar words (e.g., *station*, *office*). For young adults in ESL programs, features such as familiarity, concreteness, and length may not influence vocabulary as they do with children learning to read English. An assessment—the Insight assessment's vocabulary subtest—aims to establish students' knowledge of words in the core vocabulary based on findings on word features to identify target words (Hiebert et al., 2019). Levels represent bands of words according to frequency, but words have been eliminated that are highly familiar and concrete and easily decoded. In the form of the CVA, this represents words with frequencies of 20–40 appearances per million—for example, words such as *cake*, *soap*, and *cup* are not assessed, but words such as *contrast* and *distribute* are. Administrations of the assessment have proven to predict comprehension as well as to support students' development by providing them with appropriate instruction.

Conclusion

Over 60 years ago, Gates (1961, 1962) showed that second graders knew over 75% of the third and fourth grade words that were recommended for instruction in core reading programs. That is, 2 years before these words would be taught to students, students had knowledge of them. Thirty years later, Stallman et al. (1989) came to a similar conclusion. Both second and fifth grade cohorts performed at levels of over 70% on words from subsequent grades. A similar study has not been conducted in the intervening years, but analyses of words selected for instruction (Hiebert and Cervetti, 2012) and interventions (Hiebert and Nagy, 2021) suggest choices about word selection for vocabulary instruction have not necessarily benefited from the insights of Gates and Stallman et al.

Current research provides directions for selecting words that may benefit from direct instruction. At the same time, many questions remain about the nature of this instruction. This review did not address the different methods of direct instruction. In particular, differential instruction for words with different features has not been addressed. Some words (e.g., *slender*, *chimed*) may require only a quick reference to a known synonym, whereas other conceptually complex words (e.g., *pollution*, *visionary*) may benefit from a lesson on semantically or thematically connected words, as well as morphologically related ones. The role that facility with the core vocabulary plays in ensuring students can apply strategies in the context of meaning-making of text also requires attention.

Also critical to the future of a global community are issues of applicability to and adaptivity of recommendations for word selection to the many languages used in literacy instruction around the world. Analyses of the texts used for early reading instruction in Egypt suggest the need for a theoretical framework in the selection of words to teach in Arabic (Wolsey et al., in press). Before conclusions can be made about word selection in other languages, substantial research is required on existing practices and the distribution of words in schoolbooks of different languages. It would be hoped that a review on word selection in the years to come will show that such research has been conducted and that solutions have been identified that support the goal of ensuring students have prowess in the vocabulary needed to comprehend the complex texts of the global communities of the 21st century.

In recent decades spelling, or *orthographic* knowledge, has moved beyond being considered as simply a foundational skill for writing. It has acquired a more impressive cachet, claiming a broader linguistic, cognitive, and psychological terrain than it occupied up to the mid-20th century (Frith, 1980; Berninger, 1994, 1995; Brown and Ellis, 1994; Templeton and Morris, 2000). The pedagogical implications of this are broader as well, in part because research over the last several decades has consistently shown that orthographic knowledge is a significant if not a primary determinant in individuals' ability to *read* as well as to *write* words (Ehri, 2000, 2014; Perfetti, 2007; Perfetti et al., 1997; Rastle and Davis, 2008; Templeton and Bear, 1992/2011; Treiman and Kessler, 2014). Moreover, in English-speaking societies, a number of educators and scholars have pointed out that the spelling system of English is not a failed means of representing individual sounds, or phonemes, but rather a more logical system that works to represent both sound *and* meaning (Chomsky, 1970; Francis, 1958; Henderson, 1985; Templeton, 1979b; Venezky, 1999). The consequences for pedagogy of this research and better understanding of the logic of the system have been significant: In addition to its role as a foundational skill of written communication, spelling development now interfaces with word analysis/decoding and vocabulary instruction (International Literacy Association, 2019; Templeton and Bear, 2018; Templeton, 2020; Townsend et al., 2016).

This reconceptualization of spelling knowledge and its instruction also evolved because of the increasingly sophisticated analysis of children's and older students' spelling attempts as they interacted with the system. This work began with the seminal studies of Chomsky (1970) and Read (1971, 1975) and continued with the "Virginia Studies" of Edmund Henderson and his students at the University of Virginia (Beers and Henderson, 1977; Henderson, 1981, 1985, 1990; Henderson and Beers, 1980; Invernizzi et al., 1994; Templeton and Bear, 1992/2011) as well as Ehri (1980, 1992/2011, 1995, 2005, 2014), Ehri and Wilce (1987) and Rebecca Treiman (Bourassa and Treiman, 2008; Treiman, 1993; Treiman and Kessler, 2014). In recent years, the analysis of errors as well as their possible instructional implications is reflected in the work of a growing number of researchers (e.g., Adoniou, 2014; Bahr et al., 2012; Daffern et al., 2015; Devonshire et al., 2013; Masterson and Apel, 2010).

This chapter will address (a) the theoretical and research contributions to our understanding of how learners develop knowledge of the various types of information that the spelling system of English represents; and (b) the implications for instruction of these contributions for spelling and for its broader role in processing written language.

Explorations in the development of spelling from emergent to proficient spellers: findings from research reflecting stage, phase and alternative theoretical approaches

There are two components to spelling knowledge: (a) word-specific—knowledge of the spelling of individual words; and (b) general—knowledge about how the spelling system reflects phonology or sound, patterns of letters within syllables and between syllables, and meaning, or morphology. Treiman (2017) described learning to spell as "learning both about the visual appearance of written words and about how written words symbolize words' linguistic forms" (p. 645). Alphabetically-based orthographies may be characterized as *shallow* or *deep* (Bear et al., 2003; Katz and Feldman, 1983; Liberman et al., 1980). Shallow orthographies have a more direct, transparent, and consistent relationship between letters and the sounds they represent and are more quickly learned (Viise et al., 2011), while deep orthographies have a more opaque relationship. In the latter instance, the sounds that individual letters and groups of letters represent often depend on particular words and their structure or *morphology*. Compare, for example, the different sounds represented by the letters *m-e-d-i-c* in the words *medicine*, *medic*, and *medicinal*. Despite the variation in sounds, the spelling of the base *medic* does not vary. This is one reason English spelling has been described as *morphophonemic* (Francis, 1958;

Venezky, 1970, 1999) and more logical than commonly assumed: “There is considerable order in the spelling system. It is not a haphazard chaotic frenzy of letter-sound anomalies . . .” (Templeton, 1991, p. 186). Bowers and Bowers (2017) describe English orthography as “a morphophonemic system in which spellings have evolved to represent sound (phonemes), meaning (morphemes), and history (etymology) in an orderly way” (p. 2). What deep orthographies concede in ease of decoding print to sound may be reclaimed in ease of decoding print to meaning: words that are visually, or orthographically, similar are usually similar in meaning as well (Singson et al., 2000; Templeton, 1979a; Templeton and Scarborough-Franks, 1985).

For the past several decades, the theoretical and research landscape in spelling has been defined by *stage* or *phase* theories on the one hand and a number of alternative theories on the other—for example *overlapping waves* (Kwong and Varnhagen, 2005), *multiple linguistic repertoire* (Apel et al., 2004); *conjoint* (Bahr et al., 2009), *integration of multiple pattern* (Treiman and Kessler, 2014), and *triple word form* (Daffern et al., 2015). The explorations of invented spelling by Chomsky (1970) and Read (1971) provided a key for Edmund Henderson, one of the intellectual founders of modern stage theory in the development of orthographic knowledge, and his students to unlock the logic of the spellings of first graders (Henderson et al., 1972; Beers and Henderson, 1977), and later, of students throughout the elementary grades and beyond (Henderson and Beers, 1980; Templeton and Bear, 1992/2011). The concept of “stages” suggested by these Virginia studies as an epistemological framework emerged in part from the influence at the time of the Piagetian perspective in language and psychology (Piaget, 1973; Piaget and Inhelder, 1969) and Brown’s (1973) stages of language development. Suggesting early on that orthographic knowledge supports both reading and writing, Henderson (1980) described how the concept of stages reflected “a progressive differentiation of orthographic knowledge which in time underlies the abstract relational features by which words are identified in text and produced in written form” (p. 10).

From the beginning, however, Henderson was clear about the connotation of the term “stages.” In his classic text *Teaching Spelling* (1985) he emphasized, “The developmental stages of word knowledge, like the evolutionary periods of the language itself, are somewhat arbitrary divisions. Language change is continuous, and continuous, too, is the learner’s progress as he or she gradually masters English spelling” (p. 40). A few years later Henderson observed that “Developmental stages on any dimension of human behavior are always proximate statements with gray areas between them” (1992/2011, p. 24). Henderson’s students always emphasized the notion of stages was not “stringent” or rigid, and that more than one source of information or strategy could be available at different points in development. For example, Schlagal (2001) commented, “These stages describe common developmental themes seen across many children. They should not be taken as rigid, airtight, and invariant categories” (p. 153). The reason for emphasizing this point is because, following upon the stage theorists’ initial work, much of the research into spelling development assumed the Virginia studies’ stage-based perspective implied that learners focus *exclusively* first on sound, then on pattern, and only eventually on meaning, or morphology (e.g., Daffern et al., 2015; Devonshire et al., 2013; Treiman, 1993). Treiman and Cassar (1997), for example, stated, “Theories that treat learning to spell in terms of a sequence of stages that involve qualitatively different types of information are too simple. We must acknowledge that spellers, even young ones, are able to use various types of knowledge” (p. 78). The fundamental criticism of stage models, then, was that phonological influences do not extend to the later phases of spelling development, and morphological influences do not appear earlier in development. This point, however, was never in question; the current author observed that “[L]earners draw from *multiple sources of information* . . . the degree to which these different sources are used varies as learning progresses” (Templeton, 2003, p. 744, emphasis added) and that the developmental progression “involves complex processes in which a *number of different strategies* are called upon throughout the learning process” (Templeton and Morris, 1999, p. 105, emphasis added).

Throughout the course of continuous development, however, Henderson and his students noted that there appeared to be periods during which learners’ spelling attempts reflected their negotiation primarily, though not exclusively, of alphabetic/letter name information, within-word pattern information, or meaning/morphological information. Other stage theorists observed this developmental tendency (e.g., Nunes and Bryant, 2009), and some (Larkin and Snowling, 2008; Marsh et al., 1980; Frith, 1985) did argue for a more exclusive focus on sound first, morphology later. The work of Ehri (1992/2011), investigating the development of the ability to *read* words, interestingly complemented the work in developmental spelling; her developmental phases in reading words reflected stage theorists’ stages in spelling words. Ehri’s earlier work was framed within the stage paradigm (Ehri and Wilce, 1985, 1986), though she later explained, “We prefer the concept of phase, which is a less stringent way to characterize periods of development than the concept of stage. One phase may overlap with the next phase . . . Each phase highlights a characteristic of word learning that becomes prominent” (Ehri and McCormick, 1998, p. 140), and that prominent characteristic determines what is primarily taught.

To frame the insights from spelling research over the last few decades, two studies serve as appropriate bookends. Working within the Virginia stage theory paradigm, Schlagal’s comprehensive study of the “constancy and change” in spelling development (1992/2011) in grades one through six in the United States revealed the same error tendencies as in earlier studies described in Henderson and Beers (1980) and extended analyses to the upper elementary grades. Error types that remained constant for students through the grades included, for example, phonologically-based spellings of ambiguous vowels (digraphs such as *au*, diphthongs such as *oi*, r-colored such as *ir* and *ur*) and syllable juncture conditions determining whether or not consonants are doubled (*batted*, *admitted*, *orbited*). More recently, working within the Triple Word Form paradigm, Daffern’s comprehensive study (2017) with Australian students in years one through six found the same developmental trends that Schlagal had found for phonologically-based and for morphological spellings. The investigative focus in both stage and alternative paradigms in both studies emphasizes how learning at any point is not *only* sound, pattern, or meaning; as Templeton (2020) summarized, “Clarifying this distinction between the *predominant* focus of learners and an *exclusive* focus helps to bridge the misunderstanding between alternative and stage theorists” (p. 319).

In the following sections, focus will be on the nature of the findings from investigations by both stage and alternative theorists/researchers, and how developmental insights underlie the hierarchical, simple-to-more complex progression in spelling knowledge that integrates aspects of phonological, pattern, and morphological information. Although there will be some allusion to instructional influences, the following section will look more specifically at implications for instruction.

Emergent and beginning spellers

Even before letters appear, children's early writing attempts reflect characteristics of the print to which they are exposed (Ferreiro and Teberosky, 1982). Gradually, when letter-like figures and letters do appear, their frequency is related to how often they occur in written materials (Kessler et al., 2013; Pollo et al., 2009; Treiman, 2018; Treiman et al., 2018). With increasing exposure to print, being read to, and children's own attempts at writing, phonemic awareness begins to emerge. A number of researchers (e.g., Goswami, 2001) suggested that phonemic awareness develops through instruction in alphabetic orthography. At a fundamental level, this insight illustrates Olson's observation that "We introspect our language in terms of the categories laid down by our script" (1996, p. xii). The existence of things called "letters" and their consistent features present young children with the challenge of figuring out how they work and behave, and as children are guided by teachers and literate others in the examination of this behavior they develop awareness of and concept for an individual speech sound, or phoneme. "Print freezes the continuous stream of speech into perceptually manipulable blocks," Templeton (1980) observed, "and begins to pull a child's tacit knowledge about words to the surface where an explicit understanding can begin to develop" (p. 30).

Invernizzi and Buckrop (2018) found that learning letter names enables children to learn the sounds the letters make because most letter names contain their sound; for example, "B" contains/buh/, "M" contains/m/, "S" contains /s/. Spaces on the page, together with an understanding of beginning sounds in syllables, help the learner become aware of the printed word unit and how it matches to the spoken word unit; once this rudimentary concept of word in text is established, learners become aware of and learn how letters within the printed word unit correspond to sounds, and full phonemic awareness is developed (Bowling and Cabell, 2018; Flanigan, 2007; Morris et al., 2003a). "[T]he word begins 'to stand still' for analysis, [and children] can attend to other letter-sound properties within the word unit (e.g., the ending consonant)" (Morris et al., 2003, p. 321). Importantly, throughout this process children's *writing* plays a pivotal role; invented spelling powerfully supports the development of phonemic awareness (Copp et al., 2019; Ouellette and Sénéchal, 2017; Ouellette et al., 2013). This is first evident during the late emergent/early letter name stage (Bear and Templeton, 2000). During this time and throughout the beginning and transitional stages, the physical act of writing in development is critical, integrating the tactile and visual with sound (Planton et al., 2013; Tan et al., 2005). Developing orthographic knowledge is supported by shared neural substrates for both writing and reading (Longcamp et al., 2016; Richards et al., 2009).

The stage designation *letter name* to characterize the initial alphabetic stage arose from how young children use letter names to spell words (Read, 1971; Henderson, 1981) and then how they extended this understanding to how letters can represent sounds other than their names. Letter names are also cues, in other words, to spelling the sounds learners want to represent but which do not themselves have letter names to represent them. For example, toward the end of the kindergarten year a child wrote "ILIK SeT INDR MI FAVR TRe" (I like sitting under my favorite tree). There are letters whose names spell the long vowel sounds the child hears: LIK, MI, FAVR, TRe. She has not yet learned, however, that the letter *i* spells /i/, so in the word *sitting* she selects the letter name for *e* – /ē/ – because this sound is a cue to the sound she wants to spell: /ē/ is closer in articulation than any other vowel letter name to /i/. This decision reveals the child's tacit phonological knowledge (Read, 1971, 1975), and is an ontogenetic reflection of the long/short vowel pairings in English prior to the Great Vowel Shift (Templeton, 1976). As this child begins to learn the conventional spelling of short vowel sounds—an alphabetic rather than a simple letter name understanding—this information is now applied: MY Sitr WUS MEN TO ME WIN SHE STO MY TETY BER ("My sister was mean to me when she stole my teddy bear") (Gehsmann and Templeton, 2022). This understanding that a letter's name can also stand for a sound other than that name underlies beginners' correct representation of the plural marker *s* when it is pronounced /z/ as in *mitins* (*mitten*s), the earliest reflection of morphology in young children's spelling. Rather than reflecting an explicit awareness of its morphological function, however, children's correct spelling may come from the same understanding that a single letter can represent more than one sound, just as the letter *a* can represent /ā/ and /ă/.

Transitional spellers

Children's reading will present them with words the spelling of which represent more advanced patterns that do not reflect sequential left-to-right letter-sound pairings—for example, final *e*'s, vowel pairs or digraphs such as *ai*, *oa*, *ea*—and teachers usually address these patterns in "decoding" lessons. Both exposure to more advanced patterns through reading and explicit instruction in decoding these patterns influences children's spellings, and they grow from their linear, alphabetic expectation for how words are spelled to a relational, context-dependent expectation; that is, spellings and sounds that occur before and after a particular spelling determine that spelling (Invernizzi, 1992/2011; Schlagal, 1992/2011; Treiman and Kessler, 2006). These context-dependent patterns will reveal that English orthography is more predictable than often thought in its representation of sound. Treiman (1993, 2018) and Treiman and Kessler (2014) have explored the development of learners' awareness and understanding of this probability of particular spellings occurring in particular contexts. In describing the effects of this *statistical learning*, Treiman and Kessler (2006) observed "On this view, researchers might expect contextual effects to strengthen gradually over time, in line with children's

increasing opportunities to make the necessary observations. Researchers might also expect children to honor some contextually conditioned patterns earlier than others, with variations in speed of learning reflecting the statistical properties of the input" (p. 643). This describes the developmental continuum identified years earlier by stage theorists (Henderson and Beers, 1980; Henderson and Templeton, 1986).

When position or context of a spelling is taken into account, a greater degree of regularity emerges. For example: The *ai* spelling for long *a* occurs primarily in the middle of an English word (*rain*), never at the end; when long *a* occurs at the end of a word it is usually spelled *ay* (*stay*), less frequently *ey* (*they*) or *igh* (*sleigh*). The spelling of /j/ in single-syllable words is dependent on the quality of the preceding vowel; it is *ge* if the vowel is long (*page*) and *dge* if the vowel is short (*badge*). The sound /ch/ is usually spelled *tch* after a short vowel (*snitch*) but *ch* after a long vowel (*beach*). When children's spellings reflect their attention to these relational patterns, spelling instruction may systematically address them (Bear et al., 2020; Read and Treiman, 2013). For example, most children in grade two reveal their understanding of the function of silent *e* to signal a preceding long vowel sound through the correct spellings of *hope* and *shine*, but overgeneralize this knowledge through spellings such as *wate* for *wait*, *coche* for *coach*, and *frite* for *fright*. They can benefit from systematic spelling instruction in vowel digraphs.

In the absence of instruction addressing certain graphotactic patterns, the role of *tacit* or *implicit* learning based on their statistical probabilities has been investigated (Henderson and Chard, 1980; Treiman, 2017; Treiman and Wolter, 2018). Treiman and Kessler (2006) found that 8- to 10-year-olds were likely to spell /ē/ as *ea* rather than *e* before a final *d*; they were likely to spell the /ō/ sound with *a* after an initial *w*, as in *wander* (Kessler and Treiman, 2001). Because these patterns were not explicitly taught, it is likely that learners are tacitly picking up on these spellings based on their occurrence in print. Notably, younger learners—those whom stage theorists would describe as beginning, letter name/alphabetic spellers—are not sensitive to these types of context-dependent spellings.

At first described as the "vowel transition" stage, Henderson later suggested the term "within-word pattern," and that designation has remained in subsequent research. Both stage and phase theory emphasize that, although spelling instruction focuses primarily on single-syllable spelling patterns, this knowledge can be applied to decoding and spelling polysyllabic words. Explicit spelling instruction of the latter, however, will as explained in the next section not occur until a bit later. Early in the development of stage theory, Henderson observed that "some understanding of *base root constancy* probably accompanies the learning of the base vowel patterns" (Henderson, 1980, p. 143; emphasis added). Henderson and Templeton (1986) addressed what alternative theorists later referred to as the "overlapping" of different types of information when they observed that, during the within-word pattern stage "children also begin to deal with the third ordering principle of spelling, meaning. Readiness ... is first apparent when children begin to spell correctly the past tense ending *-ed*, despite its variation in sound" (p. 309). In addition, this is when "Teachers present the concept of base words, that is, that a base can stand alone after prefixes and suffixes are removed ... and pupils are able to learn the consistent spellings and meanings of many prefixes and suffixes" (pp. 309–310). This is because most of these affixes are predictably spelled according to pattern; at this stage, spelling many words of more than one syllable simply entails blending separate single-syllable morphemes together that are spelled according to pattern. Unlike the next significant stage of development in which spelling changes are often required when separate syllables and morphemes are conjoined, at this stage the process is more straightforward: for example, *un-* + *lock* + *-ed* = *unlocked*; *re-* + *turn* + *-ing* = *returning*.

Later studies of the development of morphological knowledge rediscovered Henderson's insight; for example, Robertson and Deacon (2019) concluded that "the relatively consistent patterns of inflectional markers in the early elementary grades ... provide a stable base" (p. 1053) for later morphological awareness and development across the grades. Deacon and Dhooge (2010), however, observed that it was not until grade four that spellings "maximally reflected" what they termed the "root consistency principle" (p. 1005). This also reflected a developmental tendency that stage theorists had observed many years before (e.g., Zutell, 1979, 1980). These findings have underscored the importance of a balance between spelling and vocabulary instruction. Deacon and Bryant suggested that "Teaching young children about root morphemes, to use magic in spelling both magical and magician, for example, may offer a simple way for children to learn about the spellings and meanings of quite complicated words" (2005, p. 387). Although this emphasis on explicitly presenting derivationally-related word families earlier than has traditionally been the case in the reading and vocabulary curricula of English-speaking countries is to be applauded, expecting students immediately or shortly thereafter to apply in their *spelling* all of the featural complexity those relationships reflect is not realistic (see below). For example, the spelling of the *-al* and *-ian* suffixes would remain a challenge for transitional spellers because there are not many exemplars in the children's reading that include those spellings, much less the accompanying context-dependent juncture spellings when they are affixed to base words. In the case of /shun/ there are not as many exemplars of derivational relationships with a corresponding orthographic representation that will help learners differentiate when to use one spelling versus a different spelling, as for example *illustrate/illustration*, *express/expression*.

Importantly, a span develops during the within word pattern stage between the ability to *read* many words accurately and the ability to *spell* those words correctly (Ahmed et al., 2014; Ehri, 2014; Morris et al., 1995a,b). As Ehri (2000) observed, "The amount of information to be drawn from memory is greater for spellers who must produce *multiple letters correctly sequenced* than for readers who must produce single pronunciations and meanings for written words" (p. 19; emphasis added). This in part is because learners' sensitivity to context-dependent orthographic patterns "emerges earlier in reading than in spelling" (Treiman and Kessler, 2006, p. 650). This is a reflection of the common psychological universal - the difference between *recognition* and *production*.

Intermediate spellers

As learners consolidate spelling pattern knowledge within single-syllable words they come to spell a majority of those words correctly. They often commit errors, however, at syllable junctures in words of two or more syllables and within unaccented syllables: *triping* for *tripping*, *slamed* for *slammed*, *leter* for *letter*; and later, *sailer* for *sailor*, *middel* for *middle*, *forchinet* for *fortunate*. These types of errors indicate a learner is in the *syllables and affixes* stage (Bear et al., 2020). Though the simple inflectional endings *-ed* and *-ing* come to be spelled correctly during the within word pattern stage, the conditions that determine the spelling of junctures when these inflectional endings are affixed to the base word are not understood and consistently applied until this stage: there may be no change (*claiming*), consonant doubling (*tapping*), or e-drop (*taping*). The spelling at syllable junctures signals important phonological information; in *tapping* the second *p* keeps the vowel sound in the first syllable short—otherwise the vowel would be long, as in *taping*. These conditions are then extended beyond affixation to the spelling of junctures within base words: *supper*, *super*.

There are of course “exceptions” to the vowel-consonant-vowel syllable juncture pattern that signals a long vowel. When these occur, a word-final spelling may be the clue (Berg, 2016; Treiman and Wolter, 2018). For example, consonant letters rarely double before *-ic*, *-it*, or *-ish* (*panic*, *comic*; *visit*, *merit*; *finish*, *punish*). Because vocabulary study at this level includes a more systematic focus on Greek and Latin roots, exploring the etymology underlying the spelling of many words that end with *-ic*, *-it*, or *-ish* often reveals a Latin root that must retain its spelling in the face of a syllable-juncture “rule”: The *n* in *finish* and *punish* does not double because the spelling of the roots *fin* and *pun* must be retained (“end”; “punish”). This type of attention helps learners realize that “exceptions” may not in fact be exceptions, but upon closer inspection, are revealed to follow patterns as well, in this case, motivated by context (spelling of an ending) and etymology.

During the latter period of this stage, learners’ spellings reflect their increasing attempts to negotiate spelling-meaning connections across words that are related through derivational morphological relationships. These connections are primarily those in which there are few if any phonological and orthographic changes within the base (e.g., *excite*-*excitement*; *ease*-*easy*-*uneasily*). English orthography becomes critical in the more expansive exploration of derivational morphology in vocabulary growth; the ability to consistently spell more advanced relationships follows later in the Proficient stage (Templeton, 1979a; Templeton and Scarborough-Franks, 1985; Zutell, 1980).

Proficient spellers

At this stage individuals become quite competent spellers and their errors reflect higher-order aspects of English orthography, for example *oppisition/opposition*, *accomodate/accommodate*, *circumfrence/circumference*, *advisible/advisable*, *dominance/dominance*, *irelevant/irrelevant*, *privelege/privilege*. A number of researchers have consistently found that knowledge of derivational morphological patterns in spelling follow an extended developmental arc across many grades (e.g., Treiman and Kessler, 2014; Robertson and Deacon, 2019; Templeton and Scarborough-Franks, 1985). The present author found that even at grades 6 and 8 students were still uncertain about spellings in which a phonological shift across derivationally-related words occurs, particularly where vowel reduction occurs as in *incline-inclination* (Templeton, 1979a; Templeton and Scarborough-Franks, 1985), a finding confirmed by subsequent studies (Robertson and Deacon, 2019; Treiman and Cassar, 1997; Tyler and Nagy, 1989). Treiman and Cassar (1997) observed, for example, that “the ability to take advantage of complex derivational relations, such as the relation between *courage* and *courageous*, is a late development” (p. 168). Robertson and Deacon summarized how “derivational morphology [in spelling] has a far more protracted period of development” (p. 1053). Nagy et al. (2006) concluded that the “role of morphology in the writing system [spelling] is grasped later than basic insight that new words can be analyzed as combinations of familiar parts. This pattern is consistent with Bear et al.’s (2004) developmental approach to spelling” (pp. 144–145).

Proficient spellers explicitly understand and apply spelling-meaning connections shared by words with more transparent spelling and sound relationships, such as *courage/courageous* and *ignite/ignition*. Most do not notice, however, more opaque relationships among words unless they are pointed out (Templeton, 1989); for example, those in which phonological changes occur without changes in spelling of the base or root (*confer/conference*, *custody/custodian*, *mandate/mandatory*, *facile/facilitate*, *spectator/inspection*, *purge/expurgate*, *territory/subterranean*) and those in which these changes occur with changes in spelling (*provoke/provocation*, *reclaim/reclamation*, *sustain/sustenance*). Almost all of these higher-level processes involve derivational morphology and classical Greek and Latin word roots, the understanding of which is also embedded within advancing vocabulary knowledge and increasing potential for understanding the role of etymology in vocabulary and spelling. At this level, a generalizable knowledge of higher-order derivational morphophonological rules including stress assignment in longer polysyllabic words is dependent on higher-order orthographic knowledge (Moskowitz, 1973; Templeton, 1979a). Rather than bringing phonological competence to bear on the examination of orthographic structure—the challenge for younger readers and spellers—the process at this level is reversed, and “the spelling system may influence the generalization of this higher order phonological knowledge” (Templeton, p. 256).

As both stage and alternative theorists have noted, throughout development the spelling of words can bring to explicit levels of awareness their morphology, and thereby their meaning (*magic-magician*). There may be developmental constraints, however, that preclude correctly spelling all of the new polysyllabic words learners will encounter (see below). At the proficient stage, these constraints are no longer a significant factor. Students can explore how spelling and morphology interact, as well as determine pronunciation, across successively more opaque relationships; for example in families such as *convene*, *convention*, *covenant*, *coven*, and *manual*, *manuscript*, *manufacture*, *manumission*, *manure*. Apparent anomalies help to expand understanding; having learned that

the Latin root *dec* means “ten” in words such as *decimeter* and *decade*, confusion at first results from attempting to apply this knowledge to the words *deciduous* and *decadence* in which *dec* does not mean “ten.” Exploration of how the letter sequence is parsed, however, reveals that two spellings of the Latin root meaning “fall”—*cid* and *cad*—combine with the prefix *de-* to express the sense of “falling away” (in the first sense, leaves falling away; in the second, a moral falling away). Again, such investigation is clearly within the purview of vocabulary development, but at this developmental level the role of orthographic representation of morphology may play a significant role in facilitating this more advanced morphological development.

The key difference between stage theories and the alternative theories that developed in response to them is the degree to which different sources of information are emphasized in instruction: What are the types of phonological, orthographic, and morphological information that teachers should be sure are available to learners at different points along the developmental continuum, and to what degree should learners be held accountable for applying these types of information consistently and correctly in their spelling? Stage theorists have noted that, although learners may be sensitive to several types of information as they spell, they consistently demonstrate productive understanding of certain types of information before others. This is acknowledged in fact by most alternative theorists as well, as their following observations attest:

All the spelling knowledge threads are useful at all grades, *although we may expect some to dominate at certain grades*
 IIA (2019, p. 9, emphasis added).

There may be greater explicit understanding of some concepts before others, e.g., understanding of magic “e” may precede understanding of when to apply the -ed rule
 Critten and Pine (2009, p. 104).

it seems that some phonological skills may be necessary before other specific phonological and morphological skills emerge
 Daffern (2017, p. 322).

In summary, most spelling theorists and researchers—stage, phase, conjoint, repertoire, overlapping waves, integration of multiple pattern, Triple Word Form—concur that the acquisition of orthographic knowledge in alphabetically-based writing systems follows a developmental trajectory that reflects the increasing complexity of the spelling system (Bahr et al., 2020; Templeton and Bear, 2018). The farther along this trajectory learners advance, the more information from phonological, pattern, and morphological influences are they able to draw and integrate so as to construct their understanding. It is time to turn to the specific implications for learning this constructive, integrative process.

Implications and recommendations for assessment and developmentally-based instruction

Gehsmann et al. (2019) emphasized that assessment, and instruction based on that assessment, should be “informed by a deep understanding of the developmental milestones associated with learning to read and write proficiently” (p. 2). This understanding, described in the first section of this chapter, underlies the discussion of spelling assessment and instruction in this section. Because English spelling represents phonological, pattern, and meaning/morphological information, how spelling instruction may be situated in a broader word study curriculum that includes phonics/decoding and vocabulary instruction will be touched upon.

Assessment

The cognitive psychologist Charles Perfetti observed, “Spelling and reading use the same lexical representation” (1993, p. 170) and therefore “spelling is the purest indicator of lexical quality” (1997, p. 30). His observation built on Henderson’s earlier conclusion (1980) regarding spelling knowledge underlying both reading and writing (Perfetti, 1986). Thus, assessing a student’s spelling should provide insight into what types of information that student is using to *read* as well as to *spell* words.

Children’s writing before they know what words are reveals their developing conceptions of print and the writing system to which they are exposed (Puranik et al., 2011; Zhang et al., 2017). They begin to incorporate letter-like features and actual letters in their writing, and eventually use letter names as cues to the “pieces” of spoken language they wish to represent (Beers and Henderson, 1977; Mann et al., 1987; Read, 1971; Treiman and Wolter, 2020). Children’s invented spelling is a very good predictor of reading success in first grade (Morris et al., 2003b; Mann, 1993), and often, “a better predictor than an oral phoneme segmentation task” (Morris et al., 2017). Its assessment value lies in the nature of the task, which is arguably more ecologically valid than a number of phoneme segmentation tasks; as Morris et al. (2017) pointed out, “the letter-by-letter spelling process slows down the process of phoneme segmentation” (p. 310). When writing *sit*, for example, the letter *s* and its sound, /s/, remain in place on the page, in effect freezing the first sound in the word, allowing the child to attend to other sounds, /i/ and /t/, in the word. This process, spelling letter-by-letter, enhances the ability to perceive and attend to individual sounds within a syllable or word.

A number of spelling assessments have been developed that attempt to identify the types of phonological, orthographic/pattern, and morphological information that learners are attempting to negotiate (Bear et al., 2020; Daffern, 2017; Ganske, 1999; Masterson and Apel, 2010; Silliman et al., 2006; Treiman et al., 2016). Stage and most alternative theorists agree that instruction should usually be grounded in the types of spelling errors that learners make as they develop knowledge of the spelling system, but they differ somewhat in the conclusions they draw as to the degree to which the errors should inform the focus of spelling instruction. Given the importance of assessment in determining the type, source, and degree of information that should be specifically included in spelling instruction, the assessment and interpretation perspectives of stage and some alternative theories are examined here.

Consider the spelling errors of a fifth grader who is struggling with reading and spelling (Masterson and Apel, 2010):

LOWFS (<i>loaves</i>)	CRETICES (<i>criticize</i>)
FRUTE (<i>fruit</i>)	MUZISHUN (<i>musician</i>)
CHOSE (<i>choice</i>)	CATIONS (<i>cautious</i>)
BLOSE (<i>blouse</i>)	

This student's errors fall across several categories: vowel patterns and diphthongs within single-syllable words; words of two or more syllables, including those that reflect more advanced features of derivational morphology, for example, *musician* and *criticize*. This profile is usually a reflection of developmentally-inappropriate instruction but may also suggest a learning disability; regardless, the developmental sequence holds for struggling readers and children identified as dyslexic as well as typically-developing readers (Bourassa and Treiman, 2008; Worthly and Invernizzi, 1990). Some alternative theorists suggest that all these types of errors be addressed in spelling instruction (Masterson and Apel, 2010). From a stage theory perspective, let's examine why this may not be advisable.

The errors in the first column represent the predominant type of information this student is trying to negotiate; the errors are characteristic of within word pattern spellers (Bear et al., 2020). This student is still learning about ambiguous, less-frequently-occurring vowel patterns as well as diphthongs, and spelling instruction should focus on one-syllable words with these patterns. The misspelled words in the second column reflect attempts to spell higher-level derivational patterns. These morphological relationships should be pointed out and discussed in terms of *vocabulary* relationships. In contrast to repertoire theory, however, the student's spelling errors in these words should not lead us to expect that this student should study and learn to correctly *spell* a wide range of higher level, derivationally-related words. Schlagal (2001) noted that attempts to do so "invites rote memorization of words, an inefficient and often impermanent form of learning" (p. 160).

Morris and his colleagues offered further support for focusing spelling instruction at the appropriate developmental level (e.g., Morris, 2011, 2021; Morris et al., 1995, 1986). Investigating the learning and retention of specific spelling words at students' instructional and frustration levels they found that, despite focused study, words at students' frustration levels (such as *cautious* and *criticize* for the student above) most likely would remain consistently misspelled. There is simply not enough underlying orthographic knowledge to support memory for the correct spelling of many such words, much less abstracting an understanding of the underlying pattern. In addition, students have often not yet learned to read these words. As noted earlier, this span between learning to read words and eventually to spell those words correctly reflects the basic psychological principle of correct recognition preceding correct production. This is why expecting students to learn to recognize new words *and* to learn and retain correct spelling of those words is to teach at their spelling frustration level—very little learning occurs. And for students who are struggling, "Reading disabilities can be prolonged and/or exacerbated" (Invernizzi and Hayes, 2011, p. 205).

Instruction

Based on students' spelling errors on well-constructed assessments, the stage model of development provides insight into the instructional balance between which aspects or components of orthography may be primarily addressed in *spelling*, and when, and which may be addressed in *word analysis/decoding* and *vocabulary*. Words at spelling frustration levels and the types of information they represent can be the focus for word-analysis or decoding instruction.

Decoding instruction—pointing out "what's going on" in words (such as the role of silent *e*, for example)—establishes the signpost. When these features begin to appear in children's spelling, either in their own compositions or on spelling inventories, they are an indication that children are ready to explore associated patterns in their spelling instruction. Vocabulary instruction may include attention to derivationally-related words, noting semantic relationships, for example, between *music-musician* and *critic-criticize*. If we try, however, to get learners to *spell* such words correctly (often believing such work will reinforce memory for the words) we will inadvertently require them to try to work at a frustration level. The *instructional* level work builds and reinforces the understandings into which the new patterns will fit.

What might engaging instructional-level activities look like? Emphasizing the importance of teaching children at all levels the logic of the spelling system, Bowers and Bowers (2017) observed, "Psychological theories of learning highlight the importance of organizing information in meaningful ways, as well as the importance of explanatory questioning in which students generate plausible explanations as to why some stated fact is true, as well as monitoring and reflecting on their learning" (p. 15). Bowers

and Kirby's *structured word inquiry* (2010) reflects this organization and focus, as do *focused contrasts* involving word sorting or categorizing words according to different criteria (Bear et al., 2020). Interestingly, this latter approach is not new. Botel (1964) observed that "we are not concerned with teaching rules, but rather with manipulating patterns, encouraging more accurate observations, and extending collections of words that belong together for some analogical reason" (p. 192). This perspective was advanced by Russell Stauffer (1969, 1970) at the University of Delaware reading clinic and later by his student, Edmund Henderson, at the McGuffey Reading Center at the University of Virginia (Henderson, 1981). Many years later, other researchers such as Nunes and Bryant (2009) and Treiman (2017) emphasized how conditional or context-dependent spellings are best learned through contrasting different cases. "Providing children with structured opportunities to discover patterns in written words," Treiman concluded, "can not only teach them about the patterns but also *increase their interest* in why words are spelled as they are" (2017, p. 649, emphasis added). Cartwright (2012) emphasized sorting activities as a way for educators to "provide multiple opportunities to think and talk about both sounds and meanings to foster children's flexible thinking about those elements of print" (p. 33).

Following are three examples illustrating how focused contrasts in word sorting activities can lead to insight and generalization about the logic underlying the English spelling system:

For transitional spellers and readers, the context-dependent spelling of the final /k/ sound is explored by sorting words such as *pack*, *broke*, and *cook* into columns according to final /k/ spelling:

<i>kick</i>	<i>bike</i>	<i>look</i>
<i>pack</i>	<i>take</i>	<i>shook</i>
<i>sock</i>	<i>strike</i>	<i>cook</i>
<i>duck</i>	<i>broke</i>	<i>took</i>

Through comparison/contrast, and if necessary the teacher's facilitative questioning (Bear et al., 2020), learners realize that *ck* is preceded by a short vowel sound, *ke* by a long vowel sound, and *k* by *oo*.

Later in the development of transitional spellers and readers, the context-dependent spelling of the final /ch/ sound is explored through sorting and examining words such as *catch*, *fetch* and *reach*, *coach*:

<i>catch</i>	<i>reach</i>
<i>pitch</i>	<i>coach</i>
<i>fetch</i>	<i>speech</i>
<i>match</i>	<i>screech</i>
<i>hutch</i>	<i>roach</i>

Students learn that a short vowel signals the following /ch/ sound is spelled *tch*; a long vowel signals *ch*. Exceptions such as *rich* and *much* are few, though they occur frequently in print and that frequency supports memory for spelling.

For intermediate spellers, the following sort explores four different spellings of the final stable syllable /el/. By sorting words into categories according to the different spellings *-al*, *-el*, *-le*, or *-il*, this examination leads students toward awareness and application of statistical probabilities as well as more advanced morphological connections that support learning and remembering the different spellings:

<i>whistle</i>	<i>channel</i>	<i>legal</i>	<i>pupil</i>
<i>bicycle</i>	<i>level</i>	<i>normal</i>	<i>fossil</i>
<i>puzzle</i>	<i>label</i>	<i>local</i>	<i>pencil</i>
<i>angle</i>	<i>quarrel</i>	<i>formal</i>	
<i>needle</i>	<i>angel</i>	<i>metal</i>	
<i>stumble</i>	<i>travel</i>		
<i>struggle</i>	<i>nickel</i>		
<i>article</i>			

After sorting the words according to the spelling of the final syllable, students are asked "Which /el/ spelling occurs most often? Least often?" Asking this question makes explicit the principle that all spellings are not equally probable, and being aware of the most frequent or frequent spellings can be of help. Interestingly, for the *-al* spellings a meaning connection may be made to related words in which the final syllable is clearly pronounced, providing a key to remembering the unaccented *-al* spelling:

<i>legal</i>	<i>legality</i>
<i>local</i>	<i>locality</i>
<i>formal</i>	<i>formality</i>
<i>normal</i>	<i>normality</i>
<i>metal</i>	<i>metallic</i>

The words that provide the clue for the *-al* spelling may be unfamiliar to the students, but by presenting them the teacher not only clears up the uncertain spelling, but importantly, expands their vocabularies as well.

A number of alternative theorists emphasized that the role of *meaning* and *etymology* in the spelling system should be addressed from the beginning of instruction (e.g., Ramsden, 1993; Adoniou, 2016; Bowers and Bowers, 2017; International Literacy Association, 2019). In so doing, children will therefore learn from the outset that the spelling system is more regular and logical because, these theorists argue, it is *not* primarily based on sound. For example, silent letters that are etymological markers explain the silent *w* in *two*: *twin*, *twice*, *twenty* (Devonshire and Fluck, 2010); by grouping *do*, *does*, *done*, and *don't* together the meaning relationship they share despite the different pronunciations of *do* becomes apparent (Bowers and Bowers, 2017); stories that explain other silent letters should be shared—in *know* and *knew* the letter was once pronounced, and the original Old English spelling was *cnawan* (Adoniou, 2016). Etymology also includes information about form, or graphotactics: English words cannot end with the letter *v* because hundreds of years ago, if *v* were doubled to mark the short vowel in words such as *have* and *love*, it would have looked like a *w*, so the practice of adding an *e* took hold.

Although it is probably the case that young children can benefit from learning that there are other reasons besides representing sound for the way words are spelled, results are mixed regarding the degree to which this additional information is incorporated (Devonshire et al., 2013; Wolter and Dilworth, 2014). At the very least, however, these few examples may help children become aware of the important *process* of etymology. This awareness may help in developing an important and facilitative mindset that there is a logic to the spelling of English, and it can help to explain what on the surface appear to be exceptions and irregularities (Adoniou, 2014; Daffern and Critten, 2019).

A closer look at developmental constraints

The apparent developmental constraints on the depth and range of orthographic understanding may be explained in part by developing brain structure and function (Sussman et al., 2016). Advances in neuroscience provide insight into understanding cognitive development and psychological processes including the learning and processing of written words. Beginning at about age 8 and reaching its peak between the ages of about 11–15, neuroanatomical development may help more specifically explain the consistent findings regarding learners' understanding and application of progressively more abstract orthographic relationships among phonology, pattern, and morphology (e.g., Brown, 2017; Brown et al., 2012; Johnson, 2011; Liebig et al., 2017; Perrachione et al., 2016; Schlaggar and McCandliss, 2007). Brown and colleagues note that "developmental alterations in the fundamental brain tissue biology and neural architecture are much more tightly linked to chronological age throughout childhood and adolescence" than was previously known (2017, p. 4). This may also underlie the significant increase in the functioning of working memory noted by Gathercole and Baddeley (2014) that occurs between 10 and 12 years of age, in turn supporting learners' engagement with longer and more orthographically complex words.

This research helps to explain why younger learners are aware of morphology and their attempted spellings reflect this awareness, but that it is not until a few years later that they are able to extend this understanding to consistently and correctly spell derivationally-related words in which phonological shifts occur, whether or not these shifts are accompanied by orthographic change (*electric-electrician*; *explode-explosion*). The generalizability, therefore, of Deacon and Bryant's (2005) suggestion regarding the use of *magic* in spelling both *magical* and *magician* as being a "simple way for children to learn about the spellings and meanings of quite complicated words" (p. 387) may not be as productive as one might hope (Rastle, 2019). Moreover, a large number of words reflecting more advanced derivational morphological relationships reflect increasingly opaque semantic relationships (e.g., *custody-custodian*; *facile-facility*; *pugnacious-impugn*). By about 9–10 years of age, however, understanding and application of morphological processes in vocabulary (e.g., Anglin, 1993) and in spelling begin to grow significantly. As Templeton (1979a) concluded, "Thus, a more efficient correspondence between an individual's sound system and the orthography may be, as Carol Chomsky (1970) expressed it, a 'late intellectual product'" (p. 262).

This should not, however, suggest a rigid deterministic framework for learning. Seeds for more advanced processes may be sown along the developmental path even at the outset—for example *magic* and *magician* and Greek roots such as *geo* and *micro* (Freeman et al., 2019)—but expectations for significant growth may be realistically tempered by developmental constraints and the consequent allocation of valuable instructional time and engagement to orthographic patterns and processes that firmly establish the foundation for later growth. As was discussed, most transitional students' word study, for example, should address spelling patterns that they are ready to examine in single-syllable words, because these words and their patterns and words occur with considerable frequency in reading materials at this level. The patterns occur in two-syllable words as well, so students' understanding of these patterns may be applied in decoding words of more than one syllable: For example, understanding the *ai* spelling in single-syllable words such as *rain* may be applied in decoding two-syllable words such as *daily*. Examining patterns through comparison

and contrast, discussion, and writing ensures that they will become internalized, making more rapid recognition and production possible.

In this latter regard, because orthographic knowledge underlies reading as well as writing, there is a body of research addressing the visual perception of words that reflects and explains what spelling stage theorists have found regarding the importance of establishing an appropriate spelling instructional level and the constraints on attempting to learn beyond that level. Research investigating the development of the perceptual span in reading has consistently supported the characterization of word knowledge as a developmental process, advancing in stages (Rayner et al., 2011); importantly, this knowledge underlies the development of fluency in reading (Chace et al., 2005; Clifton et al., 2007; Gehsmann et al., 2017; Li et al., 2014). Templeton and Bear (2018) summarized, “Readers’ underlying orthographic knowledge determines their ability to pick up an initial image based on the visual display of print, then to plan and move to the next fixation point ... the farther along the developmental [orthographic] continuum they have progressed ... the more letters they will perceive during a fixation” (p. 214). Again, the importance of appropriate, developmentally-based instruction is emphasized, particularly at the earlier stages. Teaching at these developmental levels involves “clarifying emerging concepts through the careful study of words that illustrate those concepts” (Schlagal, 2001, p. 160). In the context of engaging instructional activities such instruction provides sustained examination of simpler patterns without undue distraction of other visual and/or phonological and morphological factors. This helps learners abstract and solidify pattern knowledge that will drive reading fluency through directing and focusing examination of words during reading.

Explorations in other languages

Until the turn of this century, spelling theory and pedagogy evolved primarily from research with native English speakers learning English orthography. Since then, however, research in other languages with alphabetic orthographies has contributed significantly to the developmental landscape (e.g., Awramiuk, 2014 [Polish]; Dai et al., 2013 [Arabic]; Defior et al., 2008 [Spanish]; Diamanti et al., 2018 [Greek]; Ford et al., 2018 [Spanish]; Joshi and Aaron, 2006 [over two dozen languages and their orthographies]; Helman et al., 2015 [Spanish]; Ravid, 2012 [Hebrew]; Sénéchal, 2000 [French]; Shany and Share, 2011 [Hebrew]; Treiman and Kessler, 2021; Viise et al., 2011 [Estonian]). Though beyond the scope of this chapter, readers are referred to promising work in a number of other languages and orthographies. For example, consonant doubling patterns in Dutch follow a similar developmental trajectory as in English (Hilte and Reitsma, 2011), and derivational morphological relationships exist in a number of Romance languages that also follow similar developmental trajectories, as with the silent-sounded alternation pattern in French (*ouvert-ouverte*; Sénéchal, 2000) and consonant doubling with assimilated prefixes (*atterrir* = *ad-* + *terrir*; “to land”; Fejzo, 2016).

Work in languages with non-alphabetic scripts, including those that are nonlinear, is increasingly informing the developmental perspective (Daniels and Share, 2018; McBride, 2016 [Chinese]; Share, 2008; Shen and Bear, 2000 [Chinese]; Tong et al., 2009 [Chinese]; Winkler and Iemwanthong, 2010 [Thai]; Zhang et al., 2017 [Chinese]). Young children’s invented spelling attempts in a number of different languages and scripts is a particularly promising area of investigation (e.g., Kwak, 2007 [Korean heritage]; Martins et al., 2013 [Portuguese]; Mirzaei, 2003 [Farsi]; Yaden et al., 2015; Yaden and Tsai, 2011 [Chinese]; Zhang et al., 2017 [Chinese]). There is a growing body of research investigating the spelling of emergent bilinguals in English (Helman, 2016; Kiernan and Bear, 2018), and developmental spelling assessments have been developed for native Spanish, Korean, and Mandarin Chinese speakers (Bear et al., 2020; Helman et al., 2012; Shen and Bear, 2000).

A concluding perspective

As writing and reading increasingly occur in fluid and fractal digital spaces, the question is often raised concerning the future of spelling instruction: Won’t spell-check remove the need for attention to spelling—indeed, the need to attend to the written structure of words at all? The reconceptualization of the role of orthographic knowledge in the enterprise of literacy suggests not (Templeton, 2006). Because spelling knowledge underlies reading as well as writing, written words and the information their orthography encodes will still need to be examined and learned. In the shorter term, as social messaging encourages a more flexible orthographic license, might that chip away at standard spelling? Probably no more than the common practice in several languages of intentionally misspelling words in advertising to heighten notice of and attention to a product.

The precision of thought that a visible language offers, regardless of the orthography in which it is expressed, serves narrative and functional writing alike, affording examination and reflection. The burgeoning lexicons of digital worlds offer interesting possibilities for studying the degree to which students’ attention to words—their spellings, polysemies, connotations, and nuances—may be increasing. Will morphological processes become more transparent and intriguing as new words are coined? Orthography will be a pivotal platform from which such inquiries—by both researchers and students—may be launched.

Reading fluency, as a conceptual component of proficient reading and an instructional concept, has had a history of neglect and misunderstanding. It has been largely ignored in the so called Reading Wars (Castles et al., 2018; Goldenberg, 2020; Wyse and Bradbury, 2022) and is missing from the Simple View of Reading (Hoover and Gough, 1990). Whole Language perspectives of reading also seem to miss it as well. And yet, research has consistently demonstrated that reading fluency is critical to success in learning to read, that it is applicable at all grade levels and ages, and that many students who are not proficient in reading manifest notable difficulties in reading fluency. In this paper, we hope to explain the nature of fluency, its importance for success in reading, and how it can be taught and assessed in ways that are authentic and engaging for students and teachers.

After years of neglect, fluency returned to the mainstream professional conversation on reading with a paper by Richard Allington (1983) published in *The Reading Teacher* entitled Fluency, the Neglected Reading Goal. In the piece, Allington argued that reading fluency or, more importantly, a lack of fluency in reading is easy to detect. One needs simply to listen to a less-than-fluent reader read orally for a few minutes and recognize the student's difficulty with fluency. Even if all the words are read correctly and understood by the reader, the word-by-word, monotone reading provides ample evidence that the reader is experiencing difficulty. Yet, Allington argued, although it is easily diagnosed, it is seldom treated in actual instruction. His paper put out a call for fluency to be made a more significant part of reading, that should have equal status with word recognition (phonics) and comprehension.

Since that time, reading fluency has gained some degree of recognition among researchers and practitioners. Still, at the same time, there continues to be a diminution of fluency with respect to other reading competencies. For example, in her series of media articles, educational journalist Emily Hanford (2018, 2019) has made the case that the reason for the lack of improvement in literacy outcomes for students in the United States has been because of the way that phonics or word recognition is taught. She argued that a lack of systematic phonics as well as an overemphasis on cueing-based approaches to word recognition is the primary reason why large numbers of students fail to achieve proficiency in reading. Suggesting that a single aspect of reading instruction is at fault for generations of struggling readers is shocking. Such a claim also indirectly places less importance on other components of reading, including fluency, which continues to struggle for recognition as an essential component for full proficiency in reading.

Defining fluency

The simple view of reading (Gough and Tunmer, 1986; Hoover and Gough, 1990) suggests that the two major competencies involved in proficient reading are word decoding and language/listening comprehension. While acknowledging these important and distinct components, fluency, in a sense, links the two so that reading can become an integrated whole. Pikulski and Chard (2005) described fluency as a bridge from word recognition accuracy to text comprehension. Reading fluency is broadly defined as the ability to read the words in texts effortlessly and with expression, essentially sounding like authentic oral language.

More specifically, reading fluency is defined by its two major components: automaticity and prosody. Automaticity is the link to word decoding as it refers to the ability to recognize words automatically or effortlessly (LaBerge and Samuels, 1974). Prosody, or expression in oral reading, is the ability to read with a level of expression that reflects the meaning of text read (Schreiber, 1980).

Automaticity—The link to word recognition

It is not enough for readers to read the words they encounter in reading text accurately—they need to read the words automatically. In a landmark paper, LaBerge and Samuels (1974) posited that all readers have a limited amount of attention or cognitive resources. If readers have to use too much of their resources to decode the words in a text, less is available for the more important task in reading—comprehension. Such readers are marked by their slow, laborious, word-by-word reading of texts.

The goal should be for readers to read the words in texts not just accurately, but also *automatically*. When the words in the text are identified automatically, readers use a minimal amount of attention so as to deploy more of their cognitive resources to textual comprehension. For many readers, comprehension suffers not because of insufficient cognitive resources, but because those resources were depleted in the employment of word recognition. These are the same readers who are able to understand texts read to them—when someone else takes on the task of decoding the words, their cognitive resources can be deployed to making meaning.

As in developing automaticity in any endeavor, automaticity in reading is accomplished through practice. There are three types of practice that are worth noting here; wide reading practice, repeated (close or deep) reading practice, and assisted reading practice (Kodan and Akyol, 2018; Petersen-Brown et al., 2021; Reed et al., 2019; Therrien, 2004; Wexler et al., 2010).

Prosody—The link to comprehension

As automaticity is part of the conceptual fluency bridge that links to word recognition, prosody completes the bridge by linking fluency to comprehension. Prosody refers to a reader's ability to read aloud with an appropriate level of expression that reflects and even expands the meaning of the text (Young et al., 2021). This component is important for several reasons. First, prosodic renderings of text are more aesthetically pleasing. Hearing a story, poem, or speech read aloud expressively is arguably far more engaging than listening to a choppy and monotone read aloud. This is not only true for oral reading, but also for silent reading. There is evidence that those who read aloud with good expression also read silently with similar expression (Gross et al., 2014). Someone who is a fluent reader or speaker is likely to be described as a person who uses her or his voice to convey meaning to a listener when speaking or reading orally. Consider the following sentence:

Thomas borrowed my new car.

This declarative sentence describes an action performed by Thomas. However, emphasis on a single word can add implied meaning to the sentence.

Thomas borrowed my new car. (Thomas, not Raymond, borrowed my car.)

Thomas *borrowed* my new car. (Thomas did not steal my car, he only borrowed it.)

Thomas borrowed *my* new car. (Thomas didn't borrow your car, he borrowed mine.)

Thomas borrowed my *new* car. (Thomas didn't borrow my old car, he borrowed the new one.)

Thomas borrowed my new *car*. (Thomas didn't borrow my new book, he borrowed my car.)

Prosody allows the reader to comprehend a text at a more nuanced level than the text itself allows. Scholars have argued that prosody in reading also assists the reader in identifying critical and meaningful phrase boundaries that are not marked by punctuation (Schreiber, 1980, 1987, 1991; Schreiber and Read, 1980; Whalley and Hansen, 2006). Again, prosody allows the reader to infer information that is not explicitly stated in the passage.

Like automaticity, prosody is highly correlated with reading comprehension (Benjamin and Schwanenflugel, 2010; Miller and Schwanenflugel, 2006; Sabatini et al., 2019; Whalley and Hansen, 2006). In a longitudinal study, Miller and Schwanenflugel (2008) found that first graders who read with more adult-like prosody were more likely to be proficient in reading comprehension by third grade. Although these studies cited are relatively recent, Goodman (1964) realized decades ago that more prosodic readers were often better readers in general.

Prosody is not an issue solely for oral reading. Many adult proficient readers indicate that they also hear themselves when reading silently. Indeed, several studies have found that readers at the third, fourth, fifth, and eighth grade levels who read orally with good prosody also tend to be good comprehenders when reading silently (Daane et al., 2005; Pinnell et al., 1995; Rasinski et al., 2009). Conversely, these same studies have also found that readers who read with limited prosody (in a more monotone and word-by-word manner) also manifest poorer comprehension when reading silently.

Prosody is related to proficient and meaningful reading—oral and silent. So how do readers develop their prosody in reading? As noted with automaticity, prosody is developed through wide and deep reading. However, when prosody is emphasized, the goal of wide and deep (repeated) reading is to achieve an expressive oral rendering of the passage that reflects the meaning of the passage.

A brief history of fluency

Early accounts of reading fluency were largely related to elocution and proper pronunciation during oral reading. Oral reading dominated the classroom prior to around 1925, emphasizing that students should read aloud accurately and with good expression through drill, practice, and correction (Hyatt, 1943). However, the work of Huey (1908) and others (e.g. Judd and Buswell, 1922) led to classroom reading instruction where silent reading became the dominant form. Indeed, through the last half of the 20th century, oral reading was largely confined to the ubiquitous and widely criticized round robin reading where teachers indiscriminately and without warning called on individual students to read during group reading instruction. It is unclear when oral reading, beyond the round robin format, worked its way back into the classroom; unlike the silent reading revolution incited by Huey and others, there was not a mass call to have students read aloud. Most likely, however, oral reading came back in the form of reading instruction and interventions. Several seminal studies in the 1960s and 70s required oral reading by students as a means of remediation; namely, the Neurological Impress Method (Heckelman, 1969) and the method of repeated readings (Samuels, 1979). In the 1980s even more reading intervention-type studies documented classroom practices that required oral reading, such as paired reading (Topping, 1989). Although the frequency of oral reading in some contexts had increased, at this point in time it had not necessarily become a part of the general or core curriculum.

As mentioned previously, Allington (1983) had deemed reading fluency a neglected reading goal. Important in this paper was his seemingly obvious recommendation that students who were identified as disfluent should receive targeted fluency instruction and not simply additional instruction in other areas such as phonics. This call for fluency instruction was not only aimed toward special education and remedial reading teachers, but to general classroom teachers. Reading fluency instruction was not simply a remediation tactic, but a good approach to developing a strong foundation for reading development and proficiency (Rasinski, 2010).

More recently, based on its review of scientific studies of reading fluency, the National Reading Panel (2000) identified reading fluency to be a major component of the reading process. The notion of fluent reading became increasingly important, and rather than waiting for a student to need remediation in reading fluency, instruction began to be introduced into the general elementary curriculum to develop all students' reading fluency. Most of the instructional approaches are based on the goals of improving automaticity and prosody and include various iterations of repeated reading and assisted reading such as readers theater (Griffith and Rasinski, 2004; Martinez et al., 1999), poetry recitation, and performance of songs (Iwasaki et al., 2013; Wilfong, 2008), making movies (Young and Rasinski, 2013), and performing speeches (Young and Rasinski, 2022).

Fluency as science

Reading fluency has a strong, theoretical foundation accompanied by a large scientific research base of historic and newly developed instructional practices that impact reading comprehension.

Automatic processes

Instant or automatic recognition of a large corpus of words is critical to fluent reading. A process is considered automatic when it operates quickly, autonomously, and requires no or minimal conscious awareness, meaning it can operate in the presence of other processes requiring full attention (LaBerge and Samuels, 1974; Rawson and Middleton, 2009). In their seminal study, LaBerge and Samuels (1974) proposed that word recognition automaticity is necessary to allow the reader to focus their limited attention on comprehension. The authors hypothesized that repeated encounters with a word results in the strengthening of the connections necessary to pronounce (and understand) the word to the point that recognition becomes automatic. Other theories hypothesized that repeated encounters with a word made it available in long-term memory as a single-step identification process (Logan, 1988; Logan and Klapp, 1991). In either instance, the end result is that it is the development of a large inventory of words that are recognized automatically and independently from context that enables one to become a fluent reader (Stanovich, 1980; Torgesen, 2004; Torgesen and Hudson, 2006).

A logical question regarding word reading asks how do the word recognition processes critical to fluent reading become automatic? The orthographic mapping theory (Ehri, 2005, 2014) hypothesizes that learning to efficiently read words in an alphabetic language requires that the individual letters within words become anchored in the reader's lexical memory by their associated

sounds. As children acquire awareness of the 44 sounds (phonemes) in the English language, they connect these sounds to the 26 individual letters and their various combinations. Through extensive practice of reading text, these connections between orthographic features within words and their associated sounds become bonded in long-term memory. In sum, children do not memorize how to pronounce strings of individual letters for the tens of thousands of words they will learn. This makes practice reading text critical to word reading and fluent reading processes (Anderson et al., 1988; Cunningham and Stanovich, 1991, 1998; Elley, 2000; Taylor et al., 1990).

Developing readers achieve word recognition automaticity in the same way that other automatic processes in life are developed—through wide, deep, and assisted practice. Wide reading refers to the common classroom practice of reading a text once followed by discussion and extension. This routine is repeated with each new text. A general purpose of wide reading is to increase the volume of reading by having students read one new text after another. This is the type of reading done by most proficient readers. Studies have demonstrated that students' achievement in reading is related to the amount of time spent reading (Postlethwaite and Ross, 1992; Samuels and Wu, 2004).

Deep or close reading is more commonly referred to as repeated reading (Samuels, 1979). Deep reading occurs when a student is asked to read a single text multiple times until fluency on that passage is achieved. The initial reading of a text for developing and struggling students who have not yet achieved automaticity in their word recognition is often marked by characteristics of disfluent reading. The slow, halting reading that characterizes less than automatic word recognition will have a detrimental effect on the reader's comprehension. However, when that text is read multiple times the reader will begin to incrementally approach fluency on that passage.

Repeated practice improves the performance of the actual text practiced. The real value of deep or repeated reading, however, is manifested when students move on to new and previously unread passages. What students gained from the repeated reading of one passage generalizes, at least in part, to new passages.

Assisted reading involves a student reading a text while simultaneously listening to a fluent oral rendering of the same text (Rasinski, 2010). Assisted reading can take a variety of forms (Rasinski, 2010) – choral reading where members of a group of readers support one another (Paige, 2011a,b), paired or duolog reading in which a more fluent reader reads with a less fluent reader (Heckelman, 1969; Topping, 1987, 1989), technology- or audio-assisted reading in which student reads and listens to a pre-recorded oral reading of the text (Carbo, 1978; Chomsky, 1976), and captioned video recordings in which the text heard on the video is also represented in captions on the video screen. Repeated and assisted reading can often be implemented in tandem where early readings of one text are done with assistance, but that assistance diminishes with subsequent readings of the text. A number of studies and reviews of research on fluency have shown that word recognition accuracy, automaticity, comprehension, and attitude toward reading improve with repeated and assisted readings (Chard et al., 2002; Dowhower, 1994; Kuhn and Stahl, 2003; Rasinski et al., 2011; Stevens et al., 2017).). Wide, deep, and assisted reading are foundational to any effective fluency program or intervention.

Prosodic processes

Peter Schreiber (1980, 1991; Schreiber and Read, 1980) provided a complementary explanation for the positive results from repeated readings. He argued that through repeated practice of a text students develop a greater awareness of the prosodic or melodic features of oral reading and speech. That is, through repeated readings, they were learning to embed in their reading the expressive and intonational features of oral speech that help to mark phrase boundaries within and between sentences and convey meaning. Dysfluent readers tend to read in a slow, word-by-word manner that does not lend itself well to prosodic and syntactically appropriate phrased reading that carries meaning. Through repeated readings, even disfluent readers are more able to capture the prosodic and syntactic essence of the text, thus improving the surface-level processing of the passage as well as text comprehension. As with spoken language, a reader uses expression and phrasing to bring a text to life making prosody important to understanding written language whether reading silently or aloud (Ashby, 2006; Cowie et al., 2002; Erikson, 2010; Fodor, 1998; Miller and Schwanenflugel, 2006; Schreiber, 1980, 1991; Schwanenflugel et al., 2004). By using prosodic features, a reader is able to bracket syntactic and semantic features of the text to improve reading comprehension (Kuhn and Stahl, 2003; Miller and Schwanenflugel, 2006; Paige et al., 2014; Rasinski, 1985). Multiple researchers in the US and other countries have shown that prosody allows for additional understanding of text beyond that accounted for by other factors. Indeed, a significant body of research over the past two decades (Benjamin and Schwanenflugel, 2010; Daane et al., 2005; Klauda and Guthrie, 2008; Miller and Schwanenflugel, 2006; Paige et al., 2012, 2014; Pinnell et al., 1995; Rasinski et al., 2009; Valencia et al., 2010; Veenendaal et al., 2014, 2016) has demonstrated the connection between prosody and comprehension.

Fluency to comprehension

An abundance of research has demonstrated that fluent reading benefits textual understanding whether one is reading aloud or silently (Carlson, 2009; Frazier et al., 2006; Rasinski et al., 2011). While fluent reading is often helpful to comprehension, it does not cause reading comprehension and does not always overcome or compensate for other associated cognitive processes. An example of this was reported by Swanson and O'Connor (2009) who found that increasing reading fluency in students with poor working memory did not increase reading comprehension.

However, for many readers improving reading fluency has been shown by multiple researchers over several decades to improve understanding of text. In a meta-analysis of 15 studies using repeated reading to improve fluency, Therrien (2004) found that fluency improved reading comprehension nearly one-half of a standard deviation. Multiple authors have found reading fluency to be consistently associated with one-fourth to over one-half of the variance in reading comprehension across elementary, middle, and secondary students (Daane et al., 2005; Fuchs et al., 2001; Jenkins, Fuchs, Espin, van den Broek and Deno, 2003a, 2003b; Kuhn and Stahl, 2003; Paige, 2011a,b; Paige et al., 2014; Pinnell et al., 1995; Schatschneider et al., 2004; Stecker et al., 1998; Wang et al., 2019; Young et al., 1996).

Reading fluency reflects the efficient operation of lower-level reading processes, that in addition to phonemic awareness include letter-sound knowledge, the application of that knowledge to decoding words, and the accumulated inventory of the reader's sight-word vocabulary (Hoover and Gough, 1990; Perfetti and Hart, 2002). The lexical quality hypothesis (Perfetti and Hart, 2002) posits that textual understanding is based on the extent to which these processes operate efficiently to connect word pronunciations to their meanings stored in the reader's long-term memory. This makes word recognition and meaning inextricably linked (White et al., 1990). Because attention, working memory, and executive function are dependent on cognitive resources, poor reading fluency requires the reader to direct a disproportionate amount of those resources to lower level decoding processes rather than to the higher level task of integrating the author's message with their background knowledge to create meaning (Kintsch, 1998; Walczyk et al., 2004).

In summary, the science supporting the importance of reading fluency to proficient reading is rich and deep. Ensuring students become fluent readers results in better understanding of text, students who are more motivated to read, and a higher likelihood of a successful academic outcome (Paige et al., 2019). Both scientific conceptualizations of reading fluency, automatic processing of the surface-level features of text, and the ability to attend to the prosodic and syntactic features of text while reading, appear compelling and are considered central elements of contemporary conceptions of reading fluency (Kuhn and Stahl, 2003).

Fluency as art

A scientific approach to understanding fluency is clearly important, however it may not be sufficient for reading instruction that aims to develop proficient, engaged, and lifelong readers. Although science informs what children need to learn at various stages of their reading acquisition, it does not fully answer the question of how that teaching of those learning outcomes should occur. We suggest that scientifically-based fluency instruction can and should be delivered in artful and authentic ways that students find engaging and worthwhile. We propose that successful teaching of reading blends both science of reading and teacher art or craft.

What do we mean when we say that teaching is an art? Art can be defined as the expression or application of human creative skill and imagination, producing works to be appreciated primarily for their emotional power. In its broadest sense, "art" means "to arrange." Art is created when someone arranges things found in the world into a new or different design or form. Thus, teachers are artists when they arrange instruction to evoke an aesthetic or emotional response from the audience: the students. Science of reading scholar and advocate Mark Seidenberg (as cited in Goldstein, 2020) acknowledged that "The science that you need to know [reading acquisition] is good. The science on how to teach it [reading] effectively is not."

Fluency is the ability to read the words in texts automatically and with a level of expression (prosody) that reflects the meaning of the text. As described earlier, two of the scientifically validated methods for developing fluency are assisted reading and repeated reading. Assisted reading involves students reading a text orally while simultaneously listening to a fluent rendering of the same text. Repeated reading involves multiple readings of a text until students can read it at a level that achieves or approaches fluent reading. Taking an artful approach, teachers need to consider authentic situations in which students engage in assisted and repeated reading for the dual purposes of increasing automatic and expressive reading of the text? One answer lies in performance. Whether actors rehearsing for a theatrical performance, poets practicing their poems for a performance at a coffee house, or authors reading over a selection of their book in anticipation of a public reading, the rehearsal often involves assisted and repeated reading. The essential difference is in the purpose of the assisted and repeated readings: to communicate with and engage an audience. Similarly, choral reading, an assisted reading strategy where students read in unison with the teacher, allows students to support one another and provides a sense of the rhythm and feel for the language of a text reflecting the author's art. Results of studies of artful approaches to fluency have been promising. For example, studies of fluency instruction using readers theater, poetry, and oratory have led to significant and substantive improvements in fluency, word decoding, and even comprehension (Griffith and Rasinski, 2004; Young and Rasinski, 2009, 2018).

Fluency—Beyond English

A growing body of evidence points to reading fluency in English as an important factor in student reading success. While there is a growing recognition of the importance of fluency in English, the research on fluency of connected text reading in other languages is less robust. Less is known about the extent to which reading fluency is a significant competency in learning to read languages other than English.

Understanding that reading fluency is an important reading competency in other languages may lead to a better understanding that reading fluency is a more universal variable across many written languages. In a longitudinal study (Kim, 2015) involving 143

Korean speaking children text reading fluency was found to be significantly associated with reading comprehension. Later, Kim (2020) examined the relationship of component reading competencies to reading comprehension in Korean with 201 first-grade children. The study's findings revealed that text reading fluency had a moderate but significant correlation ($r = 0.51$) to reading comprehension. Unlike English, the Korean language uses an alphasyllabary writing system and is relatively transparent with consistent phoneme-grapheme correspondences (Kim, 2011).

A cross-linguistic study conducted by Baker et al. (2012) aimed to investigate whether initial status and growth rates in reading fluency in Spanish and English significantly predicted reading comprehension within and across languages. Participants were 173 Spanish-speaking English learners (EL) in first grade, 156 ELs in second grade, and 142 ELs in third grade across four schools providing a paired bilingual reading program. Results from regression and path analyses indicated that students' initial scores and growth on reading fluency were strong and direct predictors of reading comprehension within the same language, but not across other languages. This suggests that reading fluency is a good predictor of reading comprehension in Spanish as well as English. Additionally, other studies at various grade levels in Spanish have found that reading fluency to be an important component of proficient reading (e.g., Calet et al., 2015; Crosson and Lesaux, 2010).

The Turkish language is orthographically transparent. Most of the studies among Turkish language users have shown strong relationships between fluency and comprehension (e.g., Basaran, 2013; Bastug and Akyol, 2012; Kocaarslan, 2019; Yildirim et al., 2020; Yildirim and Rasinski, 2014). Yildirim, Rasinski, and Kaya (2017, 2019) found positive relationships between reading fluency and comprehension for narrative texts for grades 5 through 8 and grades 6 through 8 for expository reading comprehension.

Studies in Greek have reported positive relationships between fluency and reading comprehension and literacy acquisition (e.g., Georgiou et al., 2012; Georgiou et al., 2008; Manolitsis, Grikorakis, and Georgiou, 2017). Padeliadu and Antoniou (2014), for example, investigated reading comprehension in Greek, a language that is less transparent than English, with 1070 elementary and secondary students. The findings indicated significant positive correlations between word decoding and fluency with all comprehension measures at each grade level.

Liao et al. (2020) aimed to identify the predictors of Chinese reading and literacy skills among Chinese school children in Taiwan. The Chinese language, which has an opaque orthography, employs one of the most complex orthographic systems in the world (McBride, 2016). In the study, 182 first-grade students were recruited and structural equation modeling analysis found that reading comprehension at Grade 3 was predicted by reading fluency and literacy skills at Grade 2. Other studies in Chinese have also revealed the importance of reading fluency for reading comprehension at different grade levels (e.g., Zhao, Kwok, Liu, Liu, and Huang, 2017; Joshi et al., 2012; Li and Wu, 2015; Yeung et al., 2016).

These studies, among others, of reading fluency in languages other than English suggest that fluency in reading is a significant indicator of reading proficiency in various language and orthographies, transparent as well as opaque. However, more research needs to be done within and across languages to extend our knowledge regarding the relationship and role of reading fluency with reading comprehension in still other language contexts.

Assessing reading fluency

As with other phenomenon, how reading fluency is defined reflects how it is assessed (Andreassen and Bråten, 2010; Best et al., 2008; Nation and Snowling, 1997). For many years, reading fluency has been conceptualized as text processing where a student's word identification accuracy and automaticity, usually termed Oral Reading Fluency (ORF) is measured as a reading rate or words-correct-per-minute (WCPM) metric (Deno, 1985; Hudson et al., 2005). The most common process for assessing ORF is quite simple. The student is asked to read a grade level text orally for 1 min. The examiner marks any uncorrected errors made in the reading and then determines the number of words read correctly. That score is then compared against previously established norms for grade level and time within the school year (e.g., Hasbrouck and Tindal, 2017). Despite its ease and simplicity of administration, the ORF score has proven to be strongly related to measures of reading comprehension (Deno, 1985; Fuchs et al., 2001). However, while the ORF/WCPM metric captures the automaticity component of fluency it does not provide a measure of prosody.

One major concern with frequent use of the ORF/WCPM score is that it provides students (and teachers) with an implicit notion that automaticity in word recognition is achieved through exercises in increasing students' reading speed (Samuels, 2007; Rasinski, 2010). As students are taught explicitly to read fast, their ORF/WCPM scores, and thus fluency, should improve. The problem is that students may come to incorrectly define proficient reading as merely fast reading. Missing from this line of thought is that ORF/WCPM is a consequence, not a cause, of automatic word recognition. For most fluent readers, automaticity in word recognition is caused through authentic wide, deep, and assisted reading.

While reading prosody can be assessed using computer-based, spectrographic technology, a more common approach is to closely observe a student reading a passage aloud, and then evaluate the reading for the qualities of prosodic reading using a rating scale in the form of a rubric (Benjamin and Schwanenflugel, 2010). Several rubrics have been used with the two most common being a scale used in studies of the National Assessment of Educational Progress (NAEP (Daane et al., 2005; Pinnell et al., 1995)) and the *Multidimensional Fluency Scale* (MDFS (Zutell and Rasinski, 1991); available at www.timrasinski.com > Resources). The NAEP scale is a four-indicator rubric where a 1 represents word-by-word reading and a 4 indicates fully developed, fluent reading of the text. The MDFS on the other hand, evaluates four domains of fluent reading including reading pace, smoothness, phrasing, and expression/volume. Each of these domains is then evaluated on a 1–4 scale with a 4 indicating full development. While the NAEP has a range of 4, the range of the MDFS is 4–16. Using generalizability and decision analysis

techniques, studies by Moser et al. (2014) and Smith and Paige (2019) have found that both measures exhibit high reliability. Smith and Paige also specify a protocol for rater training. Research has also found significant correlations between observer ratings of prosody and students' overall reading proficiency (Daane et al., 2005; Pinnell et al., 1995; Rasinski et al., 2009).

Standardized assessments of reading fluency include the *Gray Oral Reading Test -5* (Wiederholt and Bryant, 2012), the advantage of which allows the comparison of a reader to a large sample of peer readers. A widely used program is the *Dynamic Indicator of Basic Literacy Skills* (DIBELS; Good and Kaminski, 2005) that assess a variety of literacy competencies, including automaticity.

Although fluency assessment has traditionally been conducted on a one-to-one basis between a student and a teacher, technology has emerged that harnesses voice recognition technology that can be used to assess various aspects of fluency. Most of these assessments are available from corporations specializing in district-wide assessments. Such assessments may become more widely available as technology advances and less commercially-driven entities enter the field.

Conclusion

The emerging evidence from scientific studies is that reading fluency is a complex, foundational, and essential competency for proficient reading in English as well as other written languages. As such, intentional instruction in reading fluency must occur to ensure reading success for all students. Moreover, assessment of fluency and progress monitoring of students' growth in fluency need to also be part of such curricula. Questions however remain as to how to provide the most efficacious instruction fluency. Among these questions are the following:

- When should fluency instruction begin?
- What are the appropriate grade (age) levels for fluency instruction to occur?
- How can fluency instruction be based on the science of fluency as well as addressing the need for such instruction to be authentic and artful? Indeed, the increase in available reading fluency strategies integrated into daily classroom literacy blocks warrants further research and development of engaging activities that bolster reading fluency, which can lead to improved proficiency in reading.
- To what extent do instructional approaches aimed specifically at increasing reading rate lead to improved fluency and improved overall reading achievement.
- What text types and genre, if any, are most ideal for fluency instruction?
- What level of text, in relation to the reading level of the student, is most appropriate for fluency instruction?
- What role do/can parents and families be expected to play in developing fluency?
- How can fluency instruction be effectively delivered in virtual/online instructional environments?
- To what extent can fluency assessment be delivered through digital and remote learning programs and environments?
- To what extent is fluency a significant literacy competency beyond English and the languages mentioned in this paper?
- To what extent is fluency an issue beyond the elementary grades?
- What are the norms for word recognition automaticity (words correct per minute) beyond grade 8?
- Are there ceiling levels of fluency development after which fluency instructional need not be mandated?
- Although the term "words-correct-per-minute" includes word accuracy and automaticity and excludes prosody, many in the field use it to refer to the construct of fluency. To clarify this confounding of indicators, Paige and Magpuri-Lavell (2012) have proposed the term *accumativity* in place of words-correct-per-minute.
- How best can fluency information be communicated to parents and other constituent groups?

In addition to these questions that focus on delivering instruction in fluency to students, future research may wish to address questions about the nature of fluency and our evolving understanding of reading fluency. For example, Cartwright et al. (2019) make the case that reading fluency itself involves more than automaticity in word recognition and prosody in oral reading. They argue that executive functioning, and in particular graphophonological-semantic cognitive flexibility plays a significant role in fluent reading.

Regardless of future developments in our understanding and instruction of reading fluency, it is clear that it can no longer be ignored. Intentional and dedicated instruction in reading fluency must become a non-negotiable part of any effective elementary reading curriculum.

In his eighth grade year in a United States school, Calvin enthusiastically chose to read *The Killer Angels* (Shaara, 1974), a fictionalized account of the Battle of Gettysburg in the American Civil War. In reflecting on the narrative, a complex interplay of shifting perspectives from opposing sides of the war, Calvin marveled, “I know that just one person wrote this, but it just [doesn’t] seem that way.” Having had access to the minds, motives and emotions of multiple characters through his reading, he concluded, “Everybody was in the wrong [in the war], both sides.” The “everybody” included members of the Confederacy, whose legacy, more than 150 years later, remains a stronghold in some communities in the American South, with lingering ties to the institution of slavery and to the perpetuation of White supremacy. Calvin’s experience is remarkable not just because this book won the Pulitzer Prize, not just because Calvin had historically scored poorly on mandated, standardized tests of reading achievement, and not just because it was not required reading. Importantly, the culture of the Confederacy permeated Calvin’s immediate and extended family, some of whom participated in re-enactments of Civil War events, making his implied rebuke of this legacy as remarkable as having made sense of such a complex book.

Calvin’s story exemplifies tensions in discourse on struggling readers as they are represented in research over the past several decades. On the one hand, attention to children like Calvin who experience difficulty with reading in school has centered historically on the questions “What skills are students lacking?” and “What are the most effective ways to teach those skills?” Inherent in these questions and corresponding research are the beliefs that there is vital knowledge about reading that all children must gain, that identifying what children are missing and filling the holes will edge children closer to competence, and that the way to gain essential skills is through particular kinds of instruction delivered in specific sorts of arrangements. From this view, what children know and do not know is defined by external criteria and can be accurately measured by an adult or a computer, and what children do is wait passively to be filled with vital skills once their areas of need are determined.

On the other hand, and certainly less visible in educational policies, is the notion that children and young adults considered “struggling readers” might be viewed otherwise in contexts where they participate in literate activities outside of the academic norm. This perspective suggests the identity of struggling readers is culturally and socially constructed, by both school and the larger society (Alvermann, 2001; Hall, 2009; Kontovourki, 2012; Learned, 2016). Accordingly, negative identities around reading can be reversed when instruction honors students’ everyday literacies, invoking resources from their personal, cultural, linguistic, and social lives (Learned, 2018; Skerrett, 2012; Skerrett and Bomer, 2011).

For Calvin, both of these perspectives are relevant. We suspect that he did, indeed, struggle while reading *The Killer Angels* in multiple ways (e.g., reading fluency, vocabulary), and that if he had to take a test of how well he understood the book based on standard criteria, he might fail, and that this would be the case even in texts that better matched his grade level in terms of difficulty. We also believe that this was a rich and positive experience for Calvin, and that in this context, drawing from his cultural knowledge, he is a motivated, sophisticated reader. To ignore either of these realities would likely hamper his development, both as a reader and a human being.

Across age levels and gender, reading is positively associated with socio-emotional dimensions of a person's life (Batini et al., 2021). We propose that for school-aged struggling readers, like all readers, the development of competence in reading need not—indeed, should not—be separate from the development of their emotional, relational, and intellectual lives. When Calvin's teacher arranged for him to take up a personally meaningful literacy experience, he elevated himself intellectually and morally. Expansions of these dimensions of his development enabled him to navigate a difficult text, and likely future complexities in reading. In turn, a growing sense of competence will make it more possible for him to pursue questions of personal, social, and cultural significance. Central to this chain of consequences, though, is that Calvin read to shape the person he was becoming, not to improve his reading test scores.

We situate our perspective on struggling readers in the context of *actual reading* rather than instruction about or in service of reading. Although there is research documenting the role of the act of reading, particularly in large volume, to reading improvement (Allington and McGill-Franzen, 2021), we would draw attention instead to the both the activity within engaged reading and the consequences of engagement in reading that include, but also transcend, conventional achievement, such as the expansion of children's socioemotional capacities, their self-regulation, and their moral agency (Ivey and Johnston, 2013). Engagement in narratives, including the processing that happens while in a book and after the book is closed, along with ongoing mental conversations with characters and with others outside of books, are fertile contexts for growth across the breadth of human development, as well as growth in reading.

Reading as a transformative human experience

It likely the case that, particularly in school, struggling readers do not experience reading as a generative activity that enriches their intellectual lives and overall well-being. In contrast, it is a source of emotional stress (Kos, 1991) and a trigger for diminishing self-worth (Skaalvik, 2004). For instance, they may be preoccupied by social comparisons in terms of competence and assigned tasks (Skaalvik, 1993), as well as by strategies to hide from peers their difficulties with reading (Skaalvik, 2004). Even those students who demonstrate a degree of resilience and agency are often not able to overcome their positioning or to feel valued and socially included in classrooms (Enriquez, 2014; Learned, 2016).

Not surprisingly, reading difficulties in children and young adults are associated with negative behaviors in school (Morgan et al., 2008), high levels of anxiety (Casey et al., 1992; Willcutt and Pennington, 2000), low self-esteem and self-concept (Boyes et al., 2018; Humphrey and Mullins, 2004), somatic complaints (Arnold et al., 2005), and social problems (Goldston et al., 2007). Elementary grades struggling readers in one study were three times more prone to depression than their peers (Maughn et al., 2003), and even younger children who do not read well feel angry, sad, lonely, distractible, and unpopular (Morgan et al., 2012). Difficulties with reading have been linked not only to dropping out of school, but also to suicide (Daniel et al., 2006).

We take the position, though, that these relationships between reading difficulties and overall wellbeing are exacerbated by the instructional and discursive environment students experience. We propose that both low reading ability and poor mental and social health in students can be reversed by first identifying why a child or young adult might want to read in the first place.

Meaningful reading for struggling readers

We suspect that few children who are identified in school as struggling readers have the opportunities to experience reading meaningfully, as in the example of Calvin we described earlier. Calvin was a participant in research (Ivey and Johnston, 2013, 2015) conducted in a school in which all eighth-grade English teachers decided to forgo conventional reading instruction that focused on the building of skills and strategies in favor of a curriculum driven by students' own reading interests. In short, they made available to students a vast array of high-interest young adult books, allowed the students to choose what to read, set aside time in class to read and talk about books, and attached no assignments to students' reading. The teachers had originally made that decision from a perspective that attending to student needs would motivate them to read, with an eye toward improving reading achievement, a decision that would pay off on both counts. Students from these classrooms interviewed at the end of one school year indicated that they read substantially more and that they were engaged in their reading, rather than merely compliant, and that for many, this was a notable change. As one student put it, "Last year I didn't read at all. The only book I read is *The Outsiders* (Hinton, 1967) ... but now I read whenever I get the chance" (Ivey and Johnston, 2013, p. 261). The engagement though, was not merely behavioral, but also emotional, social, and intellectual. One lower achieving reader gave an example:

Before I Fall (Oliver, 2010) is one of those, like the first book I've ever truly gotten into, like one of those books where you could really picture yourself in that scene. Like you feel like you're with them ... I used to hate to read. I didn't really read at all. I'd sit there and turn the pages when the teacher looked at me, and that was pretty much it (p. 261).

As teachers had hoped, students' standardized test scores also rose, with more students passing compared to the previous school year, while passing rates for all students in the state compared to the previous year remained constant. This was the case also for important subcategories of students, including economically disadvantaged students, non-White students, and boys.

Although students in these classrooms were aware of how their reading skills increased, and also how they expanded their reading repertoires in terms of genre, read more critically, knew more about books, and had become better writers due to their reading, these were not the outcomes about which they were most enthusiastic and most forthcoming. They were clear that the most significant consequences for them had to do with how reading and the activity around reading had enriched their broader lives. For struggling readers, this meant not only gains in reading competence, but also, as discussed below, the cultivation of healthier mental and social worlds.

Talk about books, expanding relationships, and shifting identities

Students who had never read voluntarily, much less talked about books, reported widespread conversations through and about books—both in and out of school, with peers, teachers, and family members. These interactions helped to shift some relationships. For instance, books became tools for children to open up lines of communications with their parents, as one student explained, “Me and my mom have more things to talk about now. When she asks me about school, I can say, ‘I read a book,’ give her details about it” (Ivey and Johnston, 2013, p. 262). Other students reported making new friends over books. This was especially meaningful for struggling readers in the classes, who expanded their social networks to include peers with whom they might not typically interact. An academically advanced student noted, for instance, talking regularly with Roberto, who historically struggled in reading: “I never would have thought he was a bookworm.” She added that from her view, and due to all the reading and conversations, that “everyone has gotten so much smarter.”

The conversations, along with shifts in relationships and identities, were made possible for struggling readers because rather than having to read a book assigned to all students regardless of the difficulty level or personal relevance, or having a book selected from an intervention package, according to their “level,” per an assessment and readability formula, they chose books based on how personally meaningful the experience would be for them. Like Calvin, who we mentioned earlier, Kadeem was a struggling reader who was most engaged in books that challenged his own perspective about cultural phenomena he knew well. He read several memoirs of reformed gang members, convinced classmates to read some of the same books, and was frequently mentioned by more capable readers as a source of help when they encountered difficulty while reading. Individual differences in reading typically focus on varying degrees of competence and the comparisons between so-called good and poor readers. In contrast, the individual perspectives and everyday experiences brought to bear on the conversations about books in classrooms that prioritize meaningfulness, including those students who struggle with reading, are valuable resources for dialogic engagement, thus deeper understanding not just of books, but of selves and other (Johnston and Ivey, 2016). In such a situation, the lines between struggling and proficient reader become blurred.

Emotional and behavioral self-regulation

Students reported that the experience of reading itself had a calming effect. One girl disclosed that before eighth grade she “got sent to the office so many times” for behavioral issues. In contrast, she said, “But then when I started reading, like, I don’t get involved in so much drama anymore, so I just keep to myself, so I don’t get in trouble.” Similarly, a male classmate explained, “[Books] give me something like to do when I’m [fidgety]. I’ll just turn to the next page and read, instead of getting in trouble.”

Social imagination

For certain, the engaging books provided a useful distraction from anxiety and worries that might have otherwise resulted in trouble for students. But the experiences with the books also made them think differently about the impact of their words and actions on others. The social worlds of narratives, and particularly the mental lives of characters who have captured the interest and investment of readers, are fertile sites for understanding the experiences of others (Mar and Oatley, 2008).

Eighth-grade students in the Ivey and Johnston (2013, 2015) studies routinely described taking up residence in the minds of characters and developing increased capacity to imagine the thinking and emotions of others, as well as the logic behind social interactions, both inside and outside of books. For some students struggling academically and socially, this opportunity made them feel less alone, but at the same time, able to reflect on their experiences, as in this example from a girl whose family was also experiencing economic struggle:

Tyrell (Booth, 2010) it made me think ... cause I was kind of raised in that kind of lifestyle ... I looked at it like it was kind of hard, you know that? But seeing how it was for somebody else, and seeing how it was for them to live it every day. But to read about someone’s life like that, it made me think ... even though I didn’t have too many things when I was little, I should still be appreciative that I had my parents in my life.

Access to characters’ minds who were both like and unlike themselves also forced them to reckon with their own social responsibility. A common theme was gaining a heightened awareness of the power of words, in some cases, specific to actual relationships in their own lives, for instance, “In part of the book that I was read, there was this girl, and her mom was all rude to her, and ... it

kind of had me feeling [really] bad, cause I was rude to my aunt, and my situation could have been worse.” Students indicated a growing propensity to anticipate the consequences of what they said, and to regulate accordingly, as one student explained:

Like, you never know if what you say to someone will be offensive. Like one little word could change somebody’s point of view over a second. They could take it the wrong way. So, I think that [*Thirteen Reasons Why* (Asher, 2007)] taught me a whole lot. Don’t say nothing that you think someone else might take in a different way.

In related research, Schrijvers et al. (2019) demonstrated that students who were asked to explore the inner psychological worlds of characters in fiction, then discuss their reading experiences with peers, reported improved insights into others as compared with students who experienced traditional literature instruction.

Intellectual engagement

Similar to Calvin’s experience with *The Killer Angels*, other eighth grade struggling readers learned that critical to knowing something well is realizing there are new perspectives to uncover. Having the opportunity to read complex books with multiple, shifting narrators—books not typically assigned in skills-oriented reading intervention programs—certainly accelerated this possibility for many students. As one student put it, “Now I like books like that the give more than one view of a story ... I don’t follow one view ... I can make up my own if I read two.” These students came to believe that their understandings were limited unless they sought out other ways of thinking. Most frequently, this meant recruiting others to read for the purpose of getting their thoughts on the moral complexities of characters’ decisions. One student suggested that getting another’s perspective was “automatically” her response to finishing a book. The purpose was not to ascertain the basic plot or main idea, but instead to further problematize the issues. Students regularly gravitated toward books they called “disturbing” due to moral ambiguities and uncertainties. A good example of their growing propensities to intellectualize their understandings of the narratives was in a small group conversation about *Living Dead Girl* (Scott, 2008), in which a young girl is abducted, abused, and held captive by an adult male. While at first the talk centered on the emotional pain of the main character, the group began to question, explicitly, what had caused her kidnapper to commit such violent acts, for example, the possibility that he had been abused in his past. The point was not to excuse the behavior, but to see all sides. Students reported that reading these sorts of books and talking to peers in this way helped them to become generally more open-minded.

Agency over future life narratives

Children and young adults, like all other humans, have the capacity to consider their own lives and exercise some agency about who they will become and how their lives will go (Sugarman and Martin, 2011). Through experiencing meaningful narratives and the social and moral dilemmas of the characters within them, and by recruiting others for conversations about these issues, the eighth-grade students in the engagement-focused classrooms began to see that they could actively structure their futures. For instance, Mason, who had long struggled with school reading, started the school year with the goal merely to “try to get on a better reading level and to read as much books as I can.” By mid-year, though, he was choosing books with characters and situations that mirrored his own, along with a group of other boys who struggled with reading and who, like Mason, had become involved in gangs. They routinely read and talked through and about stories and memoirs that brought to light the consequences of gang involvement for a person’s life trajectory. Mason reflected within a small group of these boys:

There’s a lesson in life from *Life in Prison* (Williams, 1998) and *If I Grow Up* (Strasser, 2008). There are lots of opportunities, but you have to choose the right one. Like Tookie Williams, if he wasn’t in prison, he might not have been executed. Then Deshawn [from *If I Grow Up*], he had the opportunity to get an education, but he did something different.

Kadeem, a friend of Mason’s, had a similar conversation with another group of boys, about *Yummy: The Last Days of a Southside Shorty* (Neri, 2010), a graphic novel chronicling real events in Chicago in the 1990s that resulted in the death of an 11-year-old boy with gang connections. Kadeem, who had disclosed that he was frequently left home alone, expressed sympathy for the Yummy: “He didn’t have a mom or a dad or anything. He lived with his grandma, and his grandma had all [those] kids. Nobody didn’t pay any attention to him.” When Rico lamented, “[Yummy] was just a kid” when he died, Kadeem responded, “If Yummy had lived, I think he would have changed his life.” The possibilities of both a sense of control over your life, as well as redemption, were common threads in students’ talk about and reflections on reading.

The books themselves, including both characters and dialog, also served as touchstones for some students and how they wished to design their futures. For, instance, In debriefing with peers on a conversation he had recently with his parents about academics and his future, Akeem quoted a relevant line from *The Last Shot* (Feinstein, 2005), months after he had read it: “[The character said], ‘I’m going to be the only [family member] to ever graduate and go to college’ ... And he does get good grades. He said, ‘I made my mom happy with me.’ And then she said, ‘You keep it up.’”

Reading and talking allowed the students to role-play in a safe space, taking on the situations characters face, mulling over complex decisions, experiencing the possible consequences ahead of real-life time, and adjusting for the future accordingly. As one student put it, “We’ve been reading things about people our age and the things they go through and the choices they make ... It kind of helped, because we go through those things, too, and it helps us learn about ourselves.”

Happiness

Students in the Ivey and Johnston (2013) study frequently described their experiences as “fun,” but their choices to read sometimes disturbing narratives do not parallel what is often called pleasure reading. At the end of the school year, for instance, one struggling reader who consistently read books about characters enduring psychological, emotional, and sexual trauma confessed she ended the year in a different state of mind than when she began: “I’m happier, but I can’t explain it.” For this student and others, this shift was likely connected to becoming engaged in the social worlds of books and in meaningful conversations with others. Some students reported that books and conversation had helped them overcome grief, feelings of loss, loneliness, and others indicated they had developed feelings of gratitude, optimism for the future, and intellectual competence.

It is difficult to how imagine common instructional interventions for struggling readers—focused on the building of reading skills and strategies—might lead to, even indirectly and over time, this level of personal satisfaction and overall wellbeing. How, though, can children and young adults who are experiencing difficulty with literacy, though, grow their competence within reading that matters to them? We will suggest below that it is this personal significance that catalyzes growth.

Increasing reading competence in meaningful, engaged reading experiences

The development of reading proficiency has been studied primarily in contexts where students have limited autonomy and agency, where particular skills and strategies to be learned are chosen for them, practiced in texts that have no relevance to their lives, with no connections to how they might use them to change their situations either inside or outside of school. This is not to question the value of experimental interventions, but instead to make the point that research offers much less at the moment on how literacy might develop when children and young adults have control over their own learning and when it is possible for them to explore personally and socially meaningful activities through reading.

There is enough, however, to provide a clear window into the possibilities. We can start with research exploring the degree to which particular variables influence the motivation to read. A meta-analysis by Guthrie and Humenick (2004) demonstrated that having choice, interesting texts available, and a mastery-oriented culture were strongly correlated with wanting to read, and that the opportunity to collaborate was also moderately influential. But these same variables had similarly robust effects on reading comprehension. Examining the processes of reading when a reader experiences a sense of autonomy and relevance—when they are engaged rather than merely compliant—offers a glimpse into how and what kinds of proficiencies children are building.

Reading strategically

Engaged reading itself is strategic reading (Guthrie et al., 2012). When children’s reading choices are based on how meaningful they find a text, rather than how easy or hard it is to read, they will do whatever is necessary to solve problems they encounter in their reading, thus expanding their strategic knowledge (Ivey, 2019). In many cases, these strategic moves mirror the same cognitive strategies demonstrated through research on expert readers and that comprise popular reading interventions, such as self-questioning, rereading, inferring, and summarizing. For instance, a less-experienced reader engaged in *Glimpse* (Williams, 2012) shared that while reading she “had a lot of questions.” What helped, she explained, was to “write [the questions] down on sticky notes, then I go back later and see if I can answer them ... after I’ve read more.” What makes this book puzzling is its unreliable narrator, the younger sister of a psychologically disturbed teenager, whose naivete limits her interpretation of key events. The reader is required to make inferential leaps based on their own life experiences and world knowledge. This student did not act strategically merely to ensure comprehension of the book. She was most interested in figuring out what would make the older sister of the narrator, who was around her own age, attempt suicide multiple times. Weeks after finishing the book, she told a teacher who had also read the book, “I always suspected some kind of abuse [from the mother].” In synchrony with the realization that reading might be a tool for thinking about issues arising in her everyday life and relationships, though, this same student, who described having been in remedial reading classes because of low achievement, reported also her awareness of her growing competence as a reader.

The *Glimpse* example also brings life to the finding that struggling readers might not avoid difficult books if they are meaningful, because high interest in a text buffers the potential negative effects of text difficulty (Fulmer et al., 2015; Fulmer and Frijters, 2011). As a result, students are more willing to try to read complex books, more likely to persevere, and also more inclined to create strategies specific to books, as this student described:

I go through the book and see what’s in it, to see if it has parts or weird titles of chapters. And I looked through this book, and it has like 6 parts, and the titles of the chapters are lyrics from songs. I do that with most of my books. I write the parts down on a piece of paper and use it as I read.

Ivey (2014, p. 68).

Reading minds

Earlier we described how readers engaged in narratives, particularly fiction, experience vicariously the minds and emotions of others as they access characters' thoughts. From the perspective of meaningfulness, social imagination has strong relational benefits for children and adults, as they develop an awareness of the social consequences of their own language and actions. This seems particularly true when readers are deeply immersed in the social world of the narrative and when they feel connected to characters (Carpenter et al., 2018). The capacity to imagine the thoughts and experiences of others, particularly through books, is not limited to older students or the highest achieving readers. Even young children not yet able to decode words can recognize emotions and infer characters' thoughts in picture books in tandem with the development of important social skills (Lysaker, 2019a).

From a reading development perspective, there are different, but parallel benefits. There is a growing body of work that provides consistent evidence for how theory of mind, a related phenomenon, accounts for individual differences in reading comprehension (e.g., Atkinson et al., 2017; Dore et al., 2018; Guajardo and Cartwright, 2016; Lecce et al., 2021). Lysaker (2019b) pointed out that the relational aspects of reading ought to help both redefine the properties of reading and the expansiveness of reading as a human activity. She noted, for example, "Relational experiences become important resources for comprehending and composing and can be seen as valuable contributions to comprehending activity, much like the notion of background knowledge is currently viewed" (p. 79). By the same token, she suggested, that deep comprehension would be indicated by "meaning making like emotional involvement, imagination, moral work, and relational insight" (p. 79).

Comprehending together

Engaged readers in the company of other engaged readers view each other as resources for expanding meaning (Ivey and Johnston, 2015). They often choose to read because they want to participate in conversations with friends who appear engaged, as one seventh-grade struggling reader explained: "I watch them while they read and I see how much they enjoy their book, and I wonder what it's about. I like reading after them." In such groups, it is not uncommon to take confusion to a friend, as one student described:

Like I talk to Magdalena about what happens in the books. The books she hasn't read, I give her a little bit of [information] about it. She can read it when she's done with her book. And some parts I have to get off my mind and talk through with her. And she helps me get through parts I'm stuck at. I'm either confused or it's bugging me. Like, then, I'll go back to the book, and I figure out what has happened, then I go back and tell her about it (Johnston and Ivey, 2016, p. 11).

Even students who are broadly viewed as less-able readers, when they have had meaningful experiences with particular books, can offer assistance to peers, even those normally viewed as more able. In short, reading problems are not viewed as individual problems, but as challenges to be sorted out within the community.

Unfortunately, conventional classrooms designed for struggling readers have probably not yet taken the dialogic turn in reading comprehension instruction (Wilkinson and Son, 2011) that is evident in recent advances in research. But examples from more atypical classrooms prioritizing socially engaged reading (e.g., Ivey and Johnston, 2013) suggest that struggling readers not only learn to comprehend text better, but also, together, make sense of selves, other, and their relational, epistemological, and moral lives. For instance, in a conversation about a book in which a character is the victim of racial slurs, a Mexican American student announced he might become violent if he were similarly taunted. His classmate, an African American student, suggested that he might take up a more peaceful response, citing an example shown by a character in a different book the boys had read previously. Engaged reading communities such as the one occupied by these boys, also demonstrate, through examples like this, that when students are engaged, we might view deep comprehension as arising not just from a reader-text relationship, but instead, from a network that includes self, text, and other.

Arranging for reading to be meaningful for struggling readers

Altering the academic, personal, and social trajectories for children and young adults who experience the most difficulty learning to read, regardless of whether the contributing factors are differences within individuals or due to insufficient prior instruction, requires making it possible, first, for them to realize and pursue their own motivations around reading. This is most likely when students experience, simultaneously, a sense of autonomy, a sense of competence, and a sense of relatedness (Ryan and Deci, 2000). Children are also more emotionally aroused, thus more likely to learn, when their needs of a sense of autonomy, competence, and relatedness are met (Streb et al., 2015). In addition, they are less stressed (Reeve and Tseng, 2011), and are also more likely to develop healthier identities (La Guardia, 2009).

Arranging for autonomy

Readers will experience a sense of autonomy when their reading is self-initiated and self-directed, in other words, when they decide when, what, and why to read. For the least experienced readers, addressing this need is frequently oversimplified. For students who

have been engaged in reading on limited occasions or who have faced struggle without the payoff of meaningfulness, gaining a sense of autonomy is a process. Although having choices and interesting reading materials available is important to students' motivation to read (Ivey and Broadus, 2001), those who have read less might not yet know the range of personally and socially significant encounters texts have to offer them, and have not had many opportunities to choose and discuss books (Merga, 2018). For instance, Roland, a seventh-grade boy who was classified in school as learning disabled, told his teachers that he wanted books on vintage automobiles, one of his personal interests. Although the photographs had temporary appeal, the books had little new information to offer, and he quickly grew bored. What eventually engaged him was a novel he heard a classmate discussing, in which the main character was suffering through his mother's illness. This was a topic that was relevant in Roland's own life at that time, but that he could not have articulated or imagined as a topic of book when his teachers asked what he wanted to read.

Roland's example also highlights additional ways to productively complicate the notion of autonomy for struggling readers, starting with the importance of a vibrant social context. Interests are often shaped through social interaction (Bergin, 2016), and struggling readers can often identify what they find meaningful from hearing peers talk about the texts they are reading. Related, it is sometimes the desire to become involved in the rich conversations around text, to understand others, or to work through a personal problem, rather than a book itself, that channels the motivation to read. One group of eighth-grade students, for example, after hearing a classmate tearfully describe how a book with a gay character made her think about strained relationships with her own family, decided to read that same book in order to in order to better understand their classmate's life (Ivey and Johnston, 2015).

Importantly, a sense of autonomy will be undermined when assignments and tests are linked to student learning experiences (Assor et al., 2002), a situation frequently faced by struggling readers, particularly when teachers are concerned about monitoring progress in their reading development. Open literacy activities, such as self-selected reading without having to write a personal response, completing a worksheet, or answering comprehension, are not only more conducive to motivation (Turner, 1995), but also to making possible a broader range of outcomes that are relevant to individuals, rather than uniform, and also that touch the breadth of human development rather than reading growth alone.

Arranging for a sense of competence

There are common practices that certainly undermine a sense of competence for less-experienced readers, starting with common reading assignments. Requiring all students in a classroom—regardless of individual differences in reading fluency, personal interest, and knowledge about the text topic—is especially problematic. In addition to shattering a sense of autonomy, such situations accentuate differences in competence and perpetuate feelings of inadequacy for struggling readers. Equally troublesome are assignments and teacher-generated questions that demand one particular correct response and that fail to draw from students' cultural knowledge and everyday lives. Having a range of reading materials, varying in topic, genre, and difficulty level, is fundamentally necessary for students to experience reading as productive and manageable.

Struggling readers whose goal is to read in order to grapple with the complexities of being human, though, choose texts on how interesting those texts are rather than how easy or difficult. However, it is also quite possible to experience a sense of competence in contexts where encountering difficulty while reading is viewed as normal, and even expected, for all readers, regardless of achievement levels. Dialogic classrooms built on the idea that confusion is a normal property of reading are contexts with minimal risk for less experienced readers to seek assistance.

Johnston and Ivey (2016) described a classroom that commonly featured intertextual conversations. Because students came to these discussions having read different texts, rather than one text assigned for all, struggling readers were able to make unique contributions. For example, when the teacher was reading aloud to the students a book in which a troubled teenaged character needed to confide in a trustworthy adult, student Deandra asked, "Would that be like the person that the counselor was to Sonia [a character from a different book]?" (p. 214). The teacher then expanded Deandra's questions by inviting other students to describe similar relationships from books they had read. After several examples, she said to the class, "I love how Deandre made us think about the word for that—confidante" (p. 214), thus rendering Deandra an expert and fostering in her a sense of competence, but also increasing the likelihood that her peers might see her that way. This is much less likely to happen in a classroom where the object of reading is to get the main idea of one particular text.

Arranging for a sense of relatedness

With respect to her classroom, struggling reader Anna stated:

I think we've become a lot closer because we have the same taste in books, and we know we're on the same page. And our thoughts, when one person finishes off the other person starts and picks up where the other person left off.

Engaged readers, like most human beings, are fundamentally social creatures. The kind of community Anna describes is not likely to be found in reading interventions for struggling readers that rely primarily on interacting with a computer or in instructional arrangements in which children must compete and compare rather than collaborate. To be sure, it is unlikely to be found in classrooms where students finding little meaningful in the reading to talk about.

The kinship with classmates and teachers that Anna described was cultivated because of the limitless opportunities to talk through and about books in her classroom. As one student in Anna's class put it, "[Books] help us communicate in a way. It kind of helps you make new friends almost. People I would never have talked to last year, we've become like friends through books." Realizing the need for a sense of belonging, the teacher of this classroom intentionally turns children toward each other. One of the students gave this example: "Tell Tyra about [your book]"—[the teacher] said that to Charity, and Charity came over and explained the book to me and I was like, 'I really want to read it,' and that's how we became friends, through that book" (Johnston et al., 2011, p. 237).

It is also the quality of the talk that matters. A sense of relatedness is made possible in a reading classroom by having materials children can relate to. When children and young adults have personally meaningful texts they want to discuss, they open the possibility of revealing information about themselves in the process, deepening relationships, as one engaged reader put it, "I don't know how to put it, but it's just that talk, you get to talk between each other, and that makes you feel you can trust that person more" (Ivey, 2019, p. 12). The openness and encouragement to talk, which is likely in stark contrast to many traditional reading programs designed for struggling readers, changes the relational properties of the classroom, and thus individuals' engagement in learning.

Conclusions

We have proposed that a productive way forward for how we perceive and teach struggling readers ought to focus on the breadth of children's and young adults' development, not just their literacy skills. We suggested that when meaningful reading within a socially rich learning environment is prioritized, struggling readers will be motivated to expand their knowledge about reading, but in the service of expanding the richness of their personal and social lives. Doing so will require a reconceptualization of so-called reading interventions, away from skill-oriented programs wherein children practice their reading, so to speak. In meaningful interventions, reading would be resituated not as the goal of instruction now, in hopes of academic and economic survival later, but as a tool children use for building happier, healthier lives in the present.

Our proposal does not negate the role of explicit instruction in the conventional skills of reading, although we suspect that, as our examples have demonstrated, much less would be required, since engaged reading involves self-teaching and social problem-solving. Curricula driven by a fixed scope and sequence of skills would be rendered less relevant, because engaged readers learn skills in the order in which they become meaningful to them rather than in the order prescribed by an instructional program.

Most of our examples have centered on early adolescence. We are cautious when we use the phrase "struggling readers" in general, but for young children, who we expect to be still developing before and throughout the primary grades, we are especially reserved. We do suspect, though, that many reading difficulties might be prevented, if early instruction was designed to shape in positive ways children's socio-emotional, intellectual and literate lives simultaneously. The research linking literacy practices and socio-emotional growth includes even the youngest of children (Batini et al., 2021). Research that fleshes out these relationships might also attend to how children learn code-related information, such as phonics and spelling, with and through meaningful activity and when they feel a sense of agency. Writing is seldom invoked in early reading interventions, but children find it meaningful when it is centered in their social worlds and grounded in the cultures of childhood (Dyson, 1993) rather than the rules and conventions of the adult writing world. There is already some evidence that children's invented spellings, which facilitate children's meaning-making on their own terms as they compose, accelerates children's abilities to read and spell words (Ouellette and Sénéchal, 2017).

For decades, struggling readers have been famously associated with the Matthew effects phenomenon (Stanovich, 1986) caused by individual differences in the acquisition of reading competence. In short, children who learn to read early, read more, catalyzing a reciprocal relationship between their reading skill development and their cognitive growth. For children who experience learning to read, the opposite occurs, thus setting up a rich-get-richer and poor-get-poorer scenario separating competent and less competent readers. We would suggest that limited opportunities for struggling readers to reap personal, relational, and intellectual benefits of meaningful reading adds another dimension to problem. A reversal of both problems, and possibly a bounty of growth across the breadth of human development that we have yet to fully know, must start with the reading and social activity that really matters to students in their everyday lives.

Dyslexia refers typically to the difficulties that some children have in learning to read. Though its definition varies widely and has been contested and refined from different angles in different decades and contexts (c.f. [Elliot, 2020](#)), it most often refers to a profile of difficulties learning to read that, taken together, describe a profile of difficulty learning to read. While dyslexia has been studied by researchers for over 100 years there still exists debate over (a) whether dyslexia is a unique form of reading disability that differs from the most common reasons for reading difficulties and (b) how best to intervene to address the instructional needs of children identified as dyslexic ([Worthy et al., 2018](#)). There is also concern over the size of the dyslexic population, the basis necessary for identifying a child as dyslexic, and over whether there exist any proven instructional strategies for effectively teaching dyslexic children to read. Much of the concern has a long history, as [Gabriel \(2019\)](#) has noted,

Dyslexia is a contested construct within and across the fields of education, medicine and psychology. Debates about its definition, etiology, prevalence, diagnostic criteria, treatment and relationship to theories of literacy development have continued for more than a century (p. 343).

In this entry we hope to offer a broad portrait of the concerns that have been raised about the topic of dyslexia with a particular focus on the meanings ascribed to the word.

A brief etymological history of the term “dyslexia”

If we backtrack roughly 125 years, we will find that the term dyslexia was first used by [Berlin \(1887\)](#), to describe a condition that had earlier been called “word blindness.” A small number of scholars had been writing about word blindness since 1676 ([Hinshelwood, 1917](#)). Almost everything written about dyslexia prior to 1930 was written by a medical doctor. “Dyslexia” emerged as an educational problem around the turn of the 20th century as education became compulsory across Europe and then in the US. With more young people attending school and engaging in early literacy development, both educators and psychologists were ushered into specializing in the identification and remediation of dyslexia. As awareness of and engagement with students with difficulty learning to read expanded, so did the multiple definitions and understandings that were offered to explain dyslexia. In fact, today there are definitions of a dyslexic child available from pediatricians, neurologists, educational psychologists, special educators, general education personnel, as well as differing definitions from different educational and medical agencies at both local and national levels. Each of several professions, as well as individual researchers, have offered differing definitions of dyslexia. These differences largely center on whether dyslexia refers to any difficulty learning to read, only those that are unforeseen, or to a specific profile of reading difficulty, which itself is described variably. However, the presence of multiple definitions of dyslexia has created its’ own set of problems, as noted by several scholars:

Without an agreed-on definition that can be implemented reliably and validly, understanding the nature, causes, and best treatments for reading disability is unlikely.

[Brown Waesche et al. \(2011, p. 296\).](#)

It is difficult [to define dyslexia] because the field has been unable to produce a universally accepted definition that is not imprecise, amorphous, or difficult to operationalize.

Elliott and Grigorenko (2014, p. 5).

We would add that any estimate of the incidence of dyslexia in a population must also be taken lightly since there is no agreed upon standard for diagnosis, much less any research-based support for any estimate of its prevalence.

Varying definitions of dyslexia

The contested field surrounding the topic of dyslexia is, perhaps, best summarized by Elliott and Grigorenko (2014) in their book-length treatment of the problems confronting anyone interested in the topic. They argue that at least four major and differing definitions of dyslexia exist and each definition aligns itself with a particular profession. Elliott and Grigorenko begin by noting that dyslexia has been seen as either different from or synonymous with a variety of other terms, such as “specific reading disability,” “learning disability in reading,” “reading disorder,” “severe reading disability,” and “unexpected reading difficulty.” We would also note that most research reporting on individuals with dyslexia labels draws a sample of dyslexic subjects from a population of children that has experienced difficulty in acquiring reading proficiency alongside their peers. The size of the lag in reading development in children varies depending upon the research team. Evidence of dyslexia was, until recently, seen in a child whose reading proficiency was substantially lower than a child’s IQ would suggest it should be. However, the IQ/achievement discrepancy definition of dyslexia was dropped in the US under IDEA 2004, and today dyslexia is seen as a possibility for explaining why some children, regardless of their IQ, have significant difficulty learning to read. In particular, reading difficulties related to word recognition and spelling, which will impact other areas of reading such as fluency (via difficulties in word recognition) and therefore (via practice reading and exposure to text) vocabulary, comprehension and engagement. Shaywitz and Shaywitz (2013), for instance, noted that “Perhaps the most consistent and enduring core of the definition is the concept of dyslexia as unexpected difficulty in reading” (p. 643). The word “unexpected” in the Shaywitz’s definition also appears in the International Dyslexia Association (IDA)’s “consensus definition” which is the definition most widely adopted by states in the US:

Dyslexia is characterized by difficulties with accurate and/or fluent word recognition and by poor spelling and decoding abilities. These difficulties typically result from a deficit in the phonological component of language that is often unexpected in relation to other cognitive abilities and the provision of effective classroom instruction. Secondary consequences may include problems in reading comprehension and reduced reading experience that can impede growth of vocabulary and background knowledge.

Early evidence from states that adopted dyslexia-specific policies shows that the concept of dyslexia as an “unexpected” difficulty has great consequence for whom is identified as dyslexic and whose difficulty is assumed to be related to circumstance, race, gender or class. For example, Odegard et al. (2020) found “systematic demographic differences in whether a student is identified with dyslexia by schools even when using universal screening.” Students that attended schools with a higher percentage of minority students, with larger percentages of students with lower literacy skills, or students from minoritized backgrounds were significantly less likely to be assigned a dyslexia label in school, even when behavioral characteristics of dyslexia were observed. In other words, where reading difficulty is expected based on demographics, students are much less likely to be identified as dyslexic than those attending schools where the same difficulty is not expected.

Likewise, using data from the UK Millennium Cohort Study, Knight and Crick (2021) reported that “factors seemingly unrelated to the clinical aspects of dyslexia influence whether a child is identified as dyslexic in England and Wales.” In particular, gender, season of birth, socio-economic class and parental education were found to be significant predictors of the dyslexia label. They argue that a “dyslexic sub-group” has been created within the population of poor readers with questionable “reliability, validity and moral integrity of the allocation of the dyslexia label.”

Without prescribing a specific definition, Tunmer and Greaney (2010) offered a set of criteria for any definition of dyslexia. They included the following three components that must be present when identifying dyslexia as the cause of a child’s difficulties with reading acquisition. The three components necessary were (a) persistent difficulty in learning to read, (b) the child has access to evidence-based reading instruction, and (c) inclusionary factors. However, their criteria included that the child had had access to evidence-based reading instruction, in either or both, the classroom and intervention reading lessons. We mention this if only because this factor has been neglected in most other definitions and in the evaluations conducted to identify children as dyslexic.

It seems then that difficulty, in fact, persistent difficulty, in learning to read even when provided evidence-based reading lessons is necessary for a child to be identified as a dyslexic child. However, in our experience, evidence of access to high-quality reading lessons is almost never documented in diagnostic case reports identifying a child as dyslexic. Instead, the identification seems to simply require that the child has had the opportunity to participate in reading lessons, but has not much benefitted from this participation.

We accept that dyslexia might be used to describe a child who has experienced difficulties in acquiring reading proficiency when provided high-quality reading instruction. The issue with this definition is that different scholars would likely define and measure both “difficulties” and “high quality instruction” differently.

If dyslexic children differ from other struggling readers in some way, then the question remains as to what sort of differences the definition includes. In addition, there is little agreement on what features constitute “high quality” reading instruction. This lack of clarity in defining dyslexia seems to underlie the suggestions that dyslexia is a common affliction and affects up to 20% of the population (Shaywitz, 2005) or that dyslexia is uncommon and affects less than 1% of the population (Pressley and Allington, 2014). Mazzocco and Grimm (2013), for instance, used nonword reading scores below the 10th percentile as their criterion for identifying dyslexic students. But even 10 children out of every 100 children (10%) seems too high a cutoff point for identifying dyslexics. Those who prefer to think that dyslexia is common have argued that up to 20% of American children are afflicted with dyslexia (Shaywitz, 2005). Those who think that dyslexia is uncommon and affects less than 1% of the population hold a much different view of the disability labeled dyslexia (Pressley and Allington, 2014).

By merely adopting, revising or creating a different definition of dyslexia one can categorize any reader as dyslexic or nearly all readers as non-dyslexic. The question, then, is who benefits from setting criteria in a particular way? In some settings, the label ensures students receive access to more and better instruction, in others, it relegates their study of reading to programs that are a poor match for their existing strengths, difficulties and identities (c.f. Frankel et al., 2021; Sleeter, 2018). In some cases, the label explains a specific area of difficulty, thus allowing adults to support the student toward high academic expectations despite a delay in reading development. In other cases, the label itself lowers expectations and support considerably. The potential impact of understanding reading difficulty as dyslexia may be considered as varied as the definition itself given the social and instructional realities that greet children over time and across geographic regions.

Challenges related to assessment and categorization

Still, in the US alone, experts have suggested everything from a spectrum theory that everyone is a little bit dyslexic, but some are more than others; or that everyone is dyslexic until they learn to read, all the way to much more specific and stringent criteria that limits projected prevalence to less than 1% of the population (see Protopapas, 2019 for a discussion). This range of ways to understand what dyslexia is and is not is also visible within the category itself. Scholars have identified multiple subtypes of dyslexia using different methods of categorization (Katzir et al., 2008). One method is related to etiology, or whether the set of difficulties learning to read are developmental or acquired through stroke or brain injury. Another is by profiling specific difficulties. For example, within the area of phonological processing, which is most often associated with developmental learning disabilities rather than later injuries, there are two types of difficulties: those related to difficulty related to Rapid Automatic Naming (RAN) or the ability to quickly recognize and associate a symbol with a sound and Phonological Awareness or the ability to hear and manipulate the sounds in words (c.f. Katzir et al., 2008; Vander Stappen and ReyBroeck, 2018). One may, of course, have both difficulties at once, which is referred to as “double-deficit” or “mixed” dyslexia. Finally, given that dyslexia can be understood as having high heritability, and a complex genetic structure, neuroscientists have attempted to examine the heterogeneous relationships between genes, brain activation patterns, and reading behavior (c.f. van Zuijlen et al., 2013; see Eicher and Gruen, 2013 for a review). Amid all these possibilities for understanding and defining dyslexia, the US has seen a wave of state-level legislation enshrining definitions, screening procedures and instructional responses into state codes in the years between 2010 and 2020 (Zirkel, 2020).

For example, the International Dyslexia Association’s (IDA) definition (see above) has been adopted by and/or has informed state-specific definitions and those of other similar societies across the globe. IDA is a US.-based organization, originally called “The Orton Society,” for those with an interest in the methods of multisensory direct instruction described by Dr. Samuel Orton and Anna Gillingham in the 1930s. This formerly niche organization grew its membership in the US significantly between 2010 and the present. Its “consensus definition,” created by a panel in the early 2000s, focuses on features like a neurobiological (innate) origin, of dyslexia as well as its relationship to phonological processing and its “unexpected” nature (IDA, 2002; see Gabriel, 2018 for a discussion). The challenge with the unexpected nature of the difficulty is, as we discuss later, deciding whether and when we might expect the experience of having difficulty learning to read signals a child is dyslexic.

Today many scholars argue that a key characteristic of dyslexia is difficulties with single word decoding. Testing the ability to recognize individual words eliminates the sorts of contextual cues (semantic and syntactic) that a child might use to assist in identifying individual words were she reading a passage of continuous text (Vellutino et al., 2004). The problem with this view of dyslexia is that reading is essentially extracting meaning from printed text, a task quite different from identifying words (or nonwords) in isolation. Of course, a difficulty in identifying individual words in a passage would typically mean that comprehension would suffer. On the other hand, the ability to identify all the words in a passage does not ensure that the reader has understood what was just read. At this point, one can see the basic problem with defining dyslexia and with operationalizing that definition.

Competing theories as to the cause of dyslexia

Perceptual issues

Orton (1925) noted that dyslexic children often reversed letters and words. This was explained through his theory of dyslexia which suggested that mixed cerebral dominance was at the base for children experiencing reading difficulties and that this mixed dominance would account for the word and letter reversals he observed in some children who struggled with acquiring literacy. However, roughly 40 years later Vellutino (1979) published a book length review of the evidence for visual perceptual problems as the cause of dyslexia. He demonstrated that the reversals that Orton had noted, were in fact, common among beginning readers and that some children had difficulty resolving the issue that *b* and *d*, while reversals of each other, were still two different letters.

The study of dyslexia began to broaden in the 1980s and continues today with not only physicians and educators interested in the problem of unexpected difficulties in learning to read but also psychologists, neurologists, ophthalmologists, lawyers, and members of other professions. This broadening of the fields of interests presents the possibility that sooner rather than later there will be a breakthrough that clarifies the many areas around dyslexia where debates by opposing parties occur. But for now:

We have found ourselves in a position in which science has presided over the production of a vast volume of research studies in the field of reading difficulty, but the translation of this into a coherent body of scientific knowledge that appropriately informs legislation, and clinical and educational practice, continues to be absent.

Elliott (2020, p. 565).

This persistent problem is understood variably as a problem of knowledge translation (e.g., Solari et al., 2020), the site and nature of research (e.g., Milner, 2020) and engagement with issues of implementation (Woulfin and Gabriel, 2020). Despite these persistent problems in the translation of the vast volume of research in the area from varying fields and perspectives, research on dyslexia continues to evolve in nature and focus.

Difficulties with phonological processing

With the demise of visual perceptual-based definitions, the 1990s saw the rise of problems with phonological tasks as the reason for dyslexia. At the same time, though, problems with phonological tasks were identified as common among virtually all children experiencing difficulties with reading acquisition (Adams, 1990).

Research in neuroscience and dyslexia

Most recently, the neurological processes involved in reading have begun to be addressed but today we have only a very small body of neuroscience research available and will require substantially more neuroscience studies to inform us reliably (e.g., Munzer et al., 2020). Technology to support neuroimaging and genetic research has developed rapidly over the past decades. New technologies have created opportunities to identify and confirm differences in brain anatomy, organization and functioning between participants with and without dyslexia labels, and between participants with dyslexia labels before and after instruction or instructional intervention.
